

Agile certified practitioner - (PMI-ACP) Prep Course 3 day workshop

Trainer : Hari Prasad Thapliyal

(PMP, PMI-ACP, CSM, MBA, MCA, PGDOM, PGDFM, CIC, PRINCE2-Practitioner)

AstroWix | ACOE Global
PMI® Global Registered Education Provider (R.E.P.)

Delhi NCR: D-5, Sector 10, Noida–201 301, Phone: +91 (120) 4033 800, Fax: +91 (120) 4504 766

Mumbai: Trade Centre, Regus, 1st Floor, Bandra Kurla Complex, Bandra (E), Mumbai-400 051, TEL: +91 22 40700 861, FAX: +91 22 40700 800

Bangalore: Level 9, Raheja Towers, MG Road, Bangalore-560001, TEL: +91 80 41800 746, FAX: +91 80 41800 900

'PMI-ACP', 'PMI', and 'ACP' are registered marks of the Project Management Institute, Inc.

Faculty & Participants

An Introduction

Name, Company, Current Designation, Why
Certification, Hobby

Workshop Ground Rules

- ✓ Please keep your mobile on the silent mode. Always take your calls outside the training room.
- ✓ No corner talk! Discussions only when group discussion is allowed
- ✓ Keep your focus on the ongoing topic. Await your turn during the questionnaire round.
- ✓ Strictly follow the workshop schedule for management of time.
- ✓ There is parking lot. Write you questions and post with your name on parking lot.
- ✓ Breaks only on agreed time
 - ✓ Tea
 - ✓ Lunch
 - ✓ Tea
- ✓ Everybody need to contribute
- ✓ Use your experience only for relating the processes and best practices. To avoid confusion keep it outside of the class. Unlearning is first and biggest learning to learn something new.
- ✓ Two Bowls

Workshop Objective

- ✓ *Learn Agile Project Management best Practices* as per PMI-ACP certification requirements
- ✓ *Build confidence to handle day to day Agile Project Management Challenges*

Vedavit

- ✓ **Getting accustomed to new terminology** of Agile Project Management
- ✓ **Understand the PMI-ACP® certification process**
- ✓ **Get familiarize** with number of *multiple choice questions* in line with the PMI-ACP® Certification
- ✓ **Build confidence to face the PMI-ACP® examination challenge**

PMI® & PMI-ACP®

An Overview

PMI® - Overview

- ✓ Largest, not-for-profit global professional association for project management practitioners
- ✓ Established in 1969
- ✓ Governed by a Board of Directors; elected “volunteer” members
- ✓ PMI Office is in Newtown Square, Pennsylvania in the USA.
- ✓ Truly global membership with representation in over 190 countries.
- ✓ Chapters act as “franchises”, providing education and networking opportunities
- ✓ 35+ Community of Practices. These are created based on industry or project management subjects

PMI® – Membership Benefits

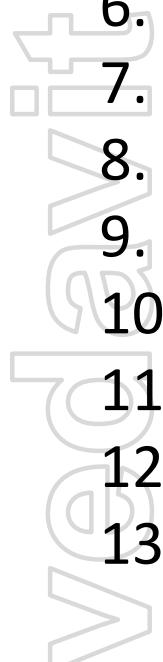

- ✓ Get member's only discount on many of PMI's valuable products
- ✓ Free Access to all PMI Standards
- ✓ Subscriptions to PM Network®, Project Management Journal® and PMI Today™
- ✓ Join PMI's Chapters and Community of Practices (CoP)
- ✓ Access the Members Area of the Web site
- ✓ Access the PMI Member Community online

<http://www.pmi.org/Membership/Pages/Types-of-Memberships.aspx>

PMI-ACP® – Certification Benefits

- ✓ Provides professional and personal recognition
- ✓ Expedites professional advancement
- ✓ Creates job growth and opportunities within an organization
- ✓ Provides a framework for standardized project management requirements
- ✓ Increases an employee's value to the organization
- ✓ You have a truly global certification.
- ✓ PMI Certified Project Managers are a preferred lot by any organizations worldwide
- ✓ High Demand due to short supply of Certified Agile Project Managers
- ✓ Increase in compensation within the organization

PMI Standards

- 
1. PMBOK Guide 5th Edition, 2013
 2. Schedule Management
 3. Risk Management
 4. Configuration Management
 5. Practice Standard for Work Break Down Structure
 6. Practice Standard for Earn Value Management
 7. Project Cost Management
 8. Construction Extension
 9. Government Extensions
 10. Portfolio Management
 11. Program Management
 12. OPM3
 13. Project Manager Competency Development Framework
Profession

PMI-ACP Exam Prerequisite

- **Certification Body :** PMI (Project Management Institute, USA)
- **Education :** Secondary Degree
- **Experience Required to apply for certificate:** 2000 hours (12 Months) general project management experience in last 5 years+ 1500 hours (8 months) experience in agile project management in last 3 years.
- **Minimum Efforts Required to pass the exam:** After taking 21 contact hours training on agile project management around 2 months efforts required to pass the exam.
- **Audit :** 25% of the applications submitted for PMI-ACP exam get audited randomly.

Exam Fees, Validity, Exam

- **Exam Fees** : Fees for PMI members : \$435, Fees for PMI non-members: \$495
 - **Re-Exam Fees** : Fees for PMI members : \$335, Fees for PMI non-members: \$395
 - **Renewal Fees** : \$90 (for members), \$130 (for non-members). Certificate is valid for next three years.
-
- **Validity of certificate** : Certificate is valid only for 3 years. Within 3 years certified person need to accumulate 30 PDUs (agile project management) and submit to PMI through online interface.
 - **Exam** : 3 hours. 120 questions. Close book exam. Passing Score not known. Online exam. 20 questions are experimental and they do not carry any score.

PMI-ACP Certification Process

1. Go through PMI-ACP training and get 21 Contact hours training
2. Get your experience data ready
3. Submit your application
4. Get your PMI-ACP application approved
5. Pay your PMI-Exam Fees
6. Book your exam at Prometric Center
7. Write you exam & Pass
8. Maintain your certificate for another 3 years by accumulating 30 PDU

Earning 30 PDU for Maintaining PMI-ACP

- ✓ Before 3rd anniversary of your PMI-ACP certificate accumulate 30 PDU in 3 years and pay \$90 to renew your certificate for another 3 years. 30 PDU accrued towards PMI-ACP certificate renewal can also be used for PMP certificate renewal.

vedavit

Ways to get 30 PDUs

- ✓ Update your Agile Project Management Knowledge
 - ✓ Attend some training on agile project management
 - ✓ Self paced on-line training on agile project management
- ✓ Giving Back to society
 - ✓ Co-author Agile PM book
 - ✓ Participate in Agile Project Management Events
 - ✓ Write Paper /Article/ Blogs on Agile PM
 - ✓ Speak on Agile Project Management from PMI platforms
 - ✓ Conduct Agile PM related trainings
 - ✓ Manage Projects using Agile Methodologies

vedavit

Topics for Examination

6 Domains for PMI-ACP Exam

1. Value Driven Delivery (15 tasks)
2. Stakeholder Engagement (7 tasks)
3. Boosting team performance practices (12 tasks)
4. Adaptive planning (9 tasks)
5. Problem detection and resolution (5 tasks)
6. Continuous Improvement (Product, Process, People) (8 tasks)

Total = 56 Major Tasks

mnemonics : ACP for Stakeholder Value Boosting

Exam Questions

- ✓ **10 Tools & Techniques – 50%**
- ✓ **43 Knowledge & Skills – 50%**

*Real Tools & Techniques are hundreds. They have not been counted because they are spread across 11 books recommended by PMI

11 Books Recommended by PMI for PMI-ACP Exam

1	Agile Retrospectives: Making Good Teams Great, Author: Esther Derby, Diana Larsen, Ken Schwaber, ISBN #0977616649
2	Agile Software Development: The Cooperative Game – 2nd Edition, Author: Alistair Cockburn, ISBN #0321482751
3	The Software Project Manager's Bridge to Agility, Author: Michele Sliger, Stacia Broderick, ISBN #0321502752
4	Coaching Agile Teams, Author: Lyssa Adkins, ISBN #0321637704
5	Agile Project Management: Creating Innovative Products – 2nd Edition, Author: Jim Highsmith, ISBN #0321658396
6	Becoming Agile in an imperfect world, Author: Greg Smith, Ahmed Sidky, ISBN #1933988258
7	Agile Estimating and Planning, Author: Mike Cohn, ISBN #0131479415
8	The Art of Agile Development, Author: James Shore, ISBN #0596527675
9	User Stories Applied: For Agile Software Development, Author: Mike Cohn, ISBN #0321205685
10	Agile Project Management with Scrum, Author: Ken Schwaber, ISBN #073561993X
11	Lean-Agile Software Development: Achieving Enterprise Agility, Author: Alan Shalloway, Guy Beaver, James R. Trott, ISBN #0321532899

Further Reading & Practice

- You must read these two handbooks for more details about PMI-ACP exam. These are available free of cost on www.pmi.org
 - PMI ACP Content Outline
 - PMI ACP Handbook Jan-2013
- You are recommended to practice simulation exam at Agile4Practice.com before you write your final exam
- If possible read following book for deeper understanding of concepts. This is one of the book recommended by PMI
 - The Art of Agile Development, Author: James Shore, ISBN #0596527675
 - http://www.jamesshore.com/Agile-Book/assess_your_agility.html

Discussions !

Agenda

- Introduction
- 10 Tools & Techniques
- 43 Knowledge and Skills

Vedavit

Disclaimer

- Agile project management (APM) is vast subject to cover in 21 hours, so do not expect to learn and know everything of APM in 3 days. ☺ ☹
- This training is based on PMI-ACP Examination Content Outline July 2011. So it does not promote any agile software tool or methodology. ☺
- Training is designed to help potential PMI-ACP candidates in preparing for PMI-ACP exam ☺
- After the training you should study around 100 hours along with simulation exams and reference books suggested by PMI before you write your final PMI-ACP exam. ☹
- We highly appreciate your specific feedback to improve quality of training material :-

Some Confusing Terminologies

- **Values -> Principles -> Practices**
 - Values and Principles are Unchanging foundation in Agile. Practices are industry specific.
 - Principles are based on values. Practices are based on Principles
- **Knowledge & skills** are virtues of the person to whom they belongs
- **Tools & Techniques** are external to the person they are not virtues of person.
- You need to have knowledge & master the skill to deliver good results in some field of work but available tools and techniques improves the quality, reduce time and cost.

Examples

- Mary can conduct a online-training workshop on project Management. In this case
 - Tool & Tech: Online Training Workshop Facilitation
 - Knowledge & Skills : Subject knowledge about Project Management
- Ram can make table
 - Knowledge & Skills: Knowledge about wood, designs, skill of carpentering.
 - Tools & Tech: Wood, hammer, saw etc.

Introduction : Project Management

Topics

- 
1. Project
 2. Project Management
 3. Program Management
 4. Portfolio Management
 5. Program Management Office
 6. Stakeholders
 7. Organization Types
 8. Responsibilities of a Project Manager

What is Project???

What is Project?

Project – A temporary endeavor undertaken to create a unique product, service or result

How Temporary?

- Has a definite *beginning and end*, not an on-going effort
- Ceases when objectives have been attained
- Team is *disbanded* upon project completion

Unique?

- The product or service is *different* in some way from other product or services
- Product characteristics are *progressively elaborated*

Project

- Is goal oriented (verifiable and measurable)
- Finite duration with a beginning and end
- Uniqueness to a great extent and related uncertainties
- Coordinated undertaking of interrelated activities
- Performing the activities involve resources
- Resources cost money

“Projects” different from “operations”?

Projects

- Permanent Project Charter
- Catalyst for change
- Unique product or service
- Heterogeneous teams
- Start and end date
- Progressive elaboration

Operations

- Semi-permanent charter
- Maintains status quo
- Standard product or service
- Homogeneous teams
- Ongoing
- Predefined product

Vedavit

Project Constraints

vedavit

Project Management?

The application of **knowledge, skills, tools and techniques** to project activities in order to **meet the project requirements**

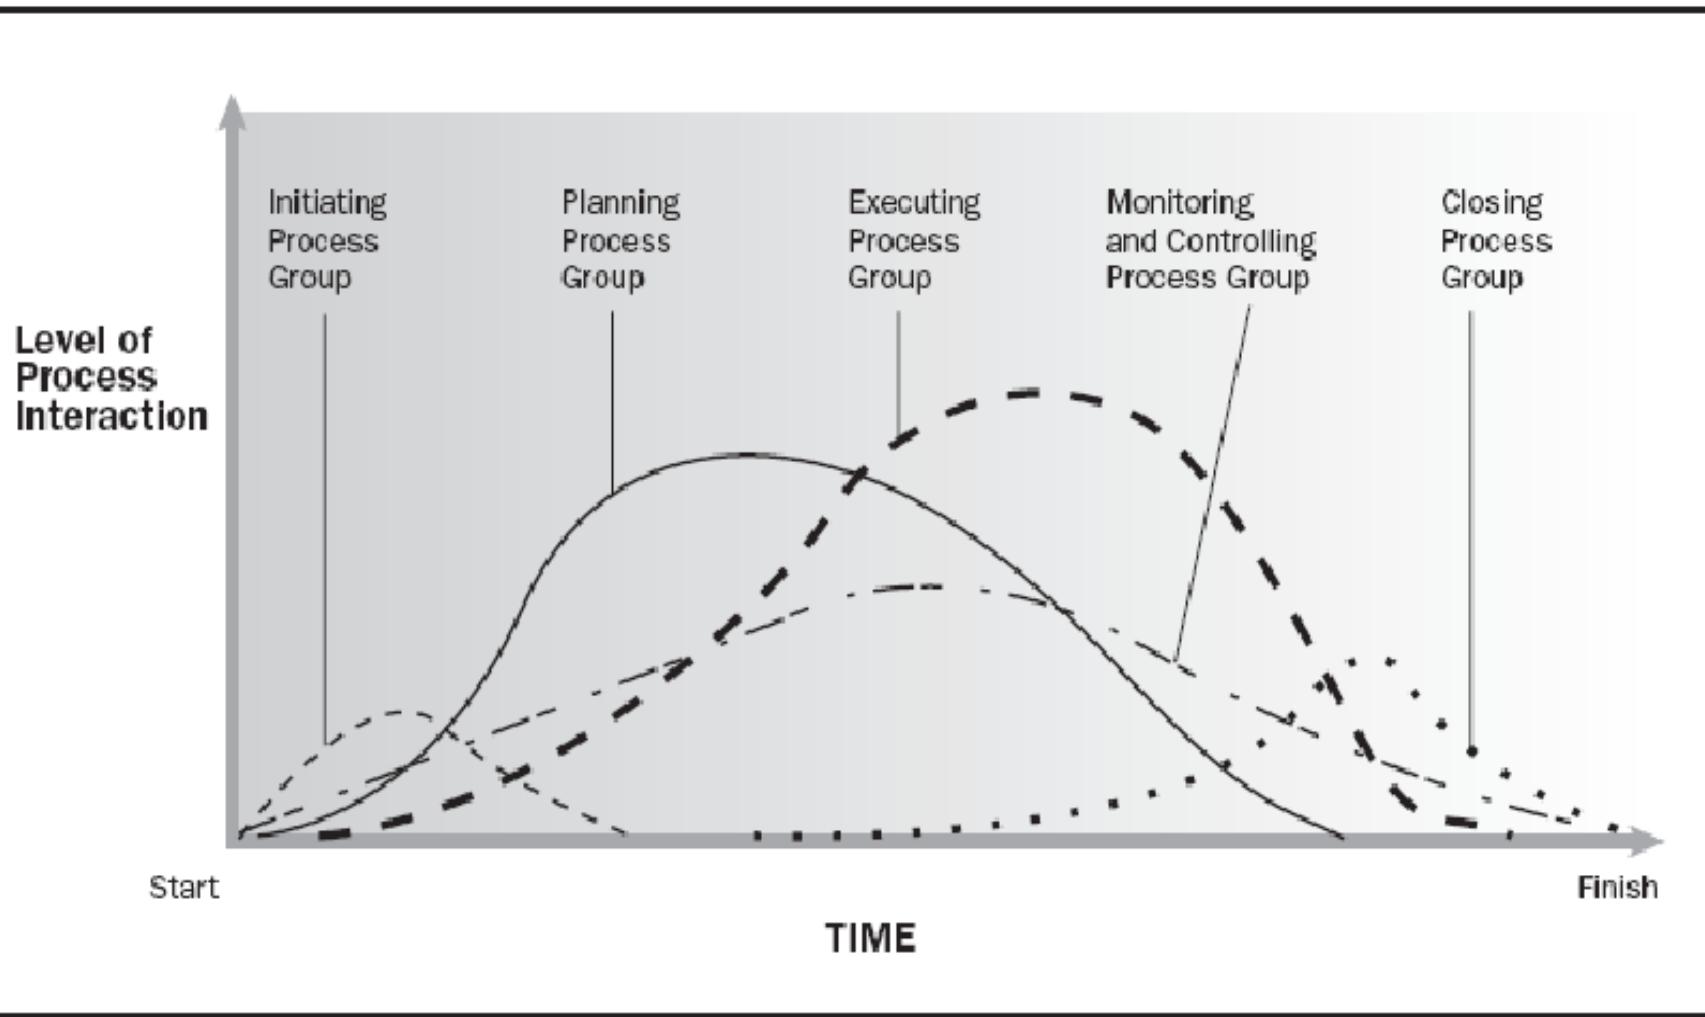

Requirements are put by

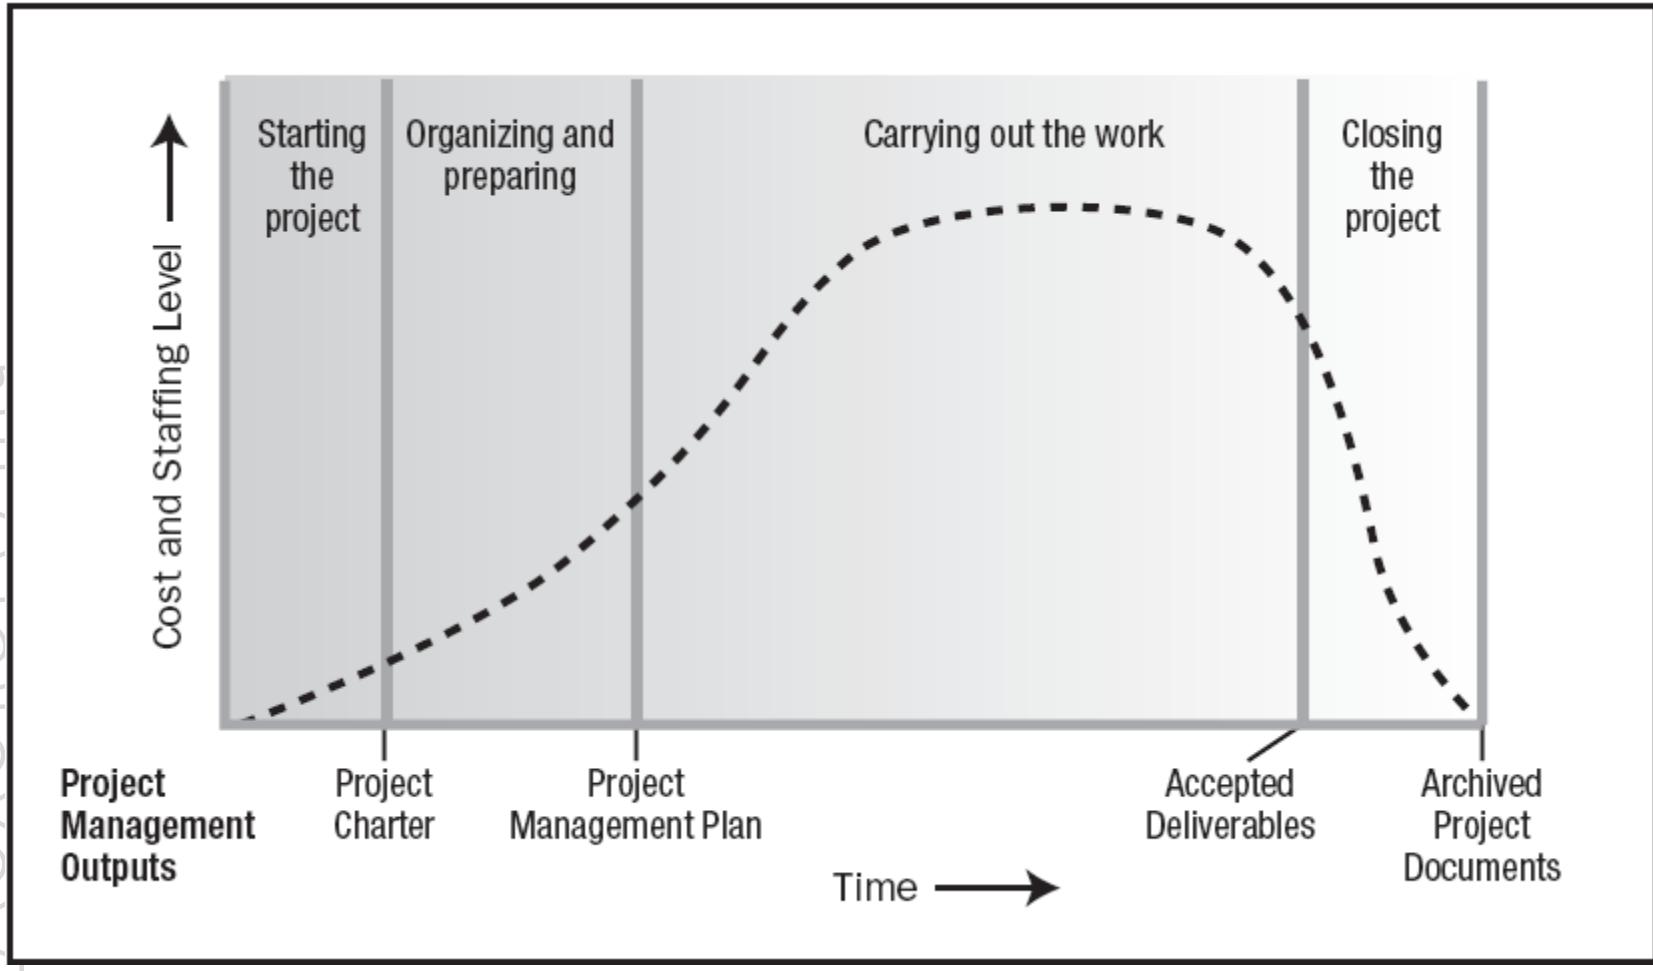

Project Phases

- ✓ A project is divided into phases where extra control is required to effectively manage the completion of the major deliverables
- ✓ Collectively, the project phases put together is known as Project life cycle (PLC)
- ✓ Each phase is marked by one or more tangible verification work product
- ✓ The conclusion of a project phase is generally marked by a review
- ✓ The phase end points are referred to as phase exits, milestones, phase gates, decision gates, stage gates or kill points
- ✓ Starting a phase before approval of deliverables of a previous phase is called Fast Tracking

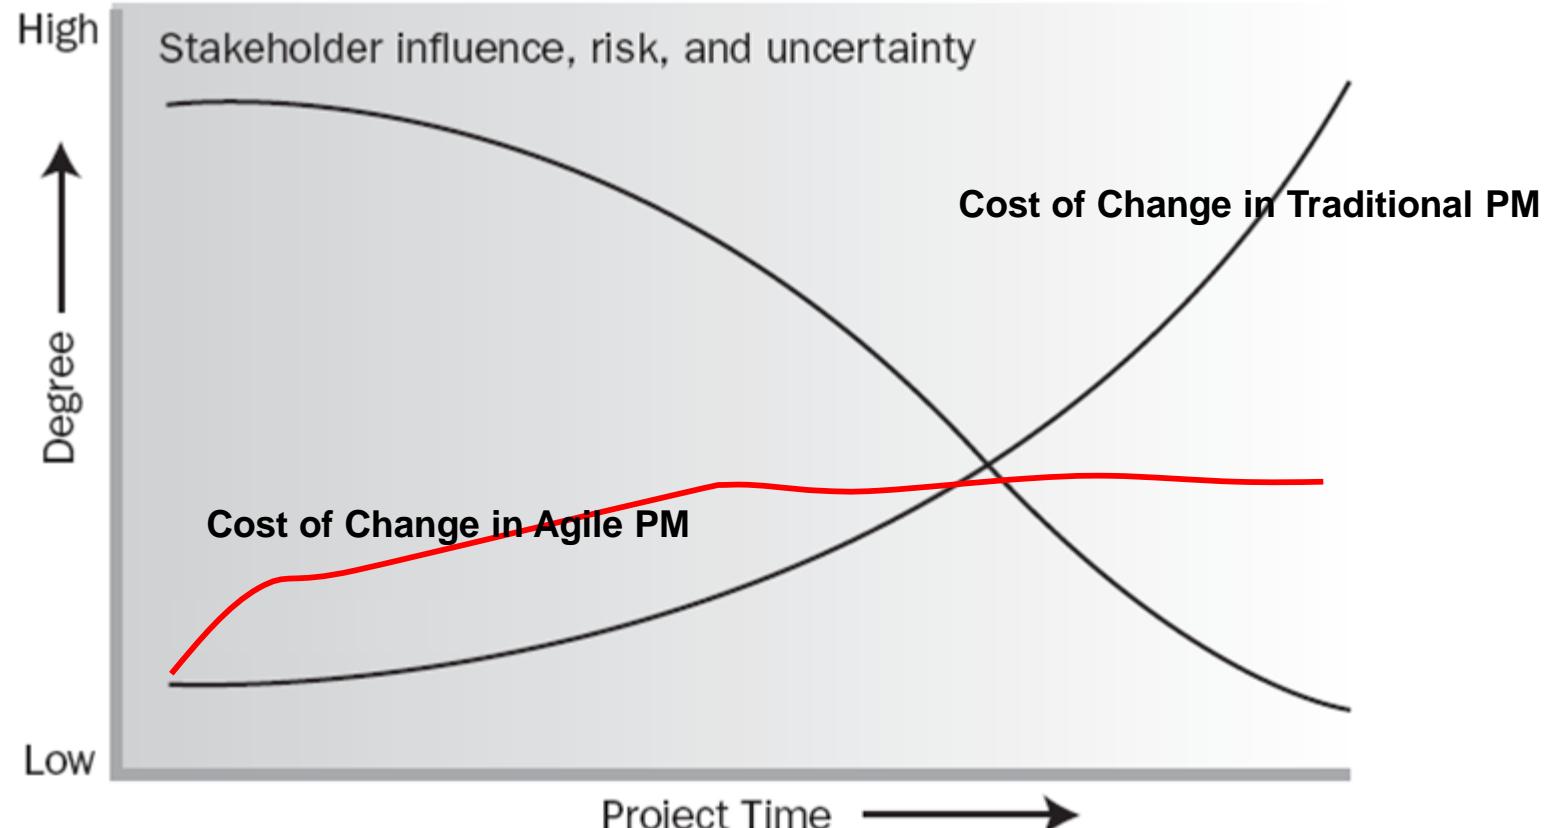

Typical PLC & Level of Activities

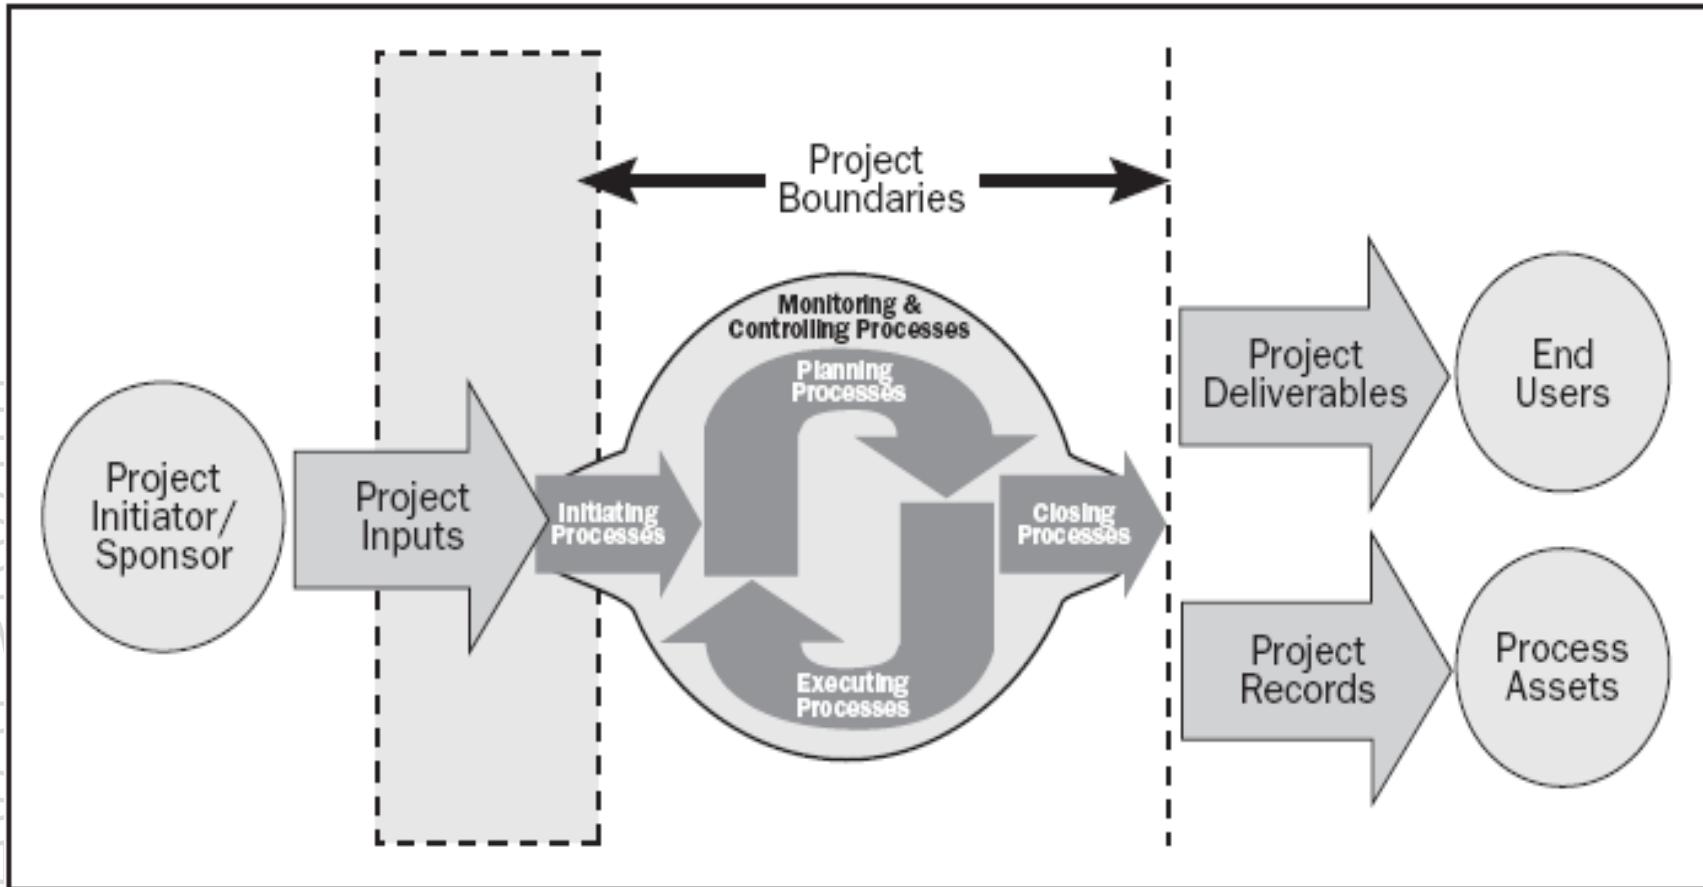

Typical Costing & Staffing across PLC

Impact of Variables based on Time

Project Boundaries

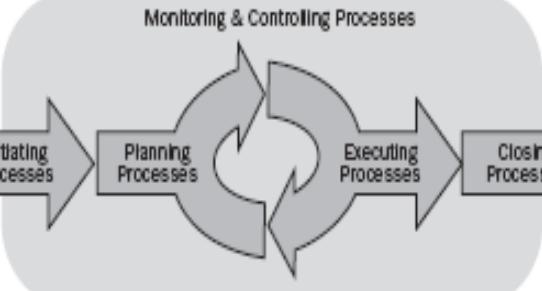

Relationship between Process Group & Phases

One Approach to Cleaning Up a Hazardous Waste Site

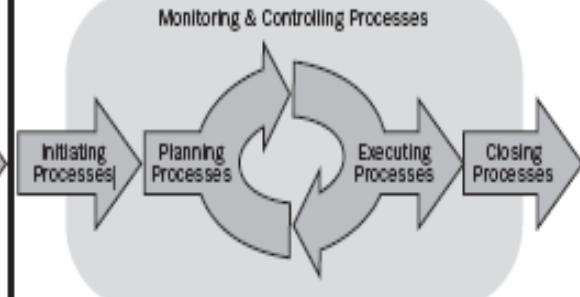

Facility Decommissioning

Waste Removal/Cleanup

Landscaping

V@D
TOP

What is Program?

Group of related projects managed in a coordinated way to obtain benefits and control not available from managing them individually

Project Portfolio Management

Collection of projects or programs and other work that are grouped together to facilitate effective management of that work to meet strategic business objectives

Portfolio manager is responsible for prioritizing project or programs, seek funding for his portfolio project

What is PMO?

- ✓ Managing shared resources across all project administered by PMO
- ✓ Identifying and developing project management methodologies, best practices and standards
- ✓ Coaching, mentoring, training and oversight
- ✓ Monitoring compliance with project management standards, policies, procedures and templates via project audits
- ✓ Developing and managing project policies, procedures, templates and other shared documentation (organizational process assets), and
- ✓ Coordinating communication across projects

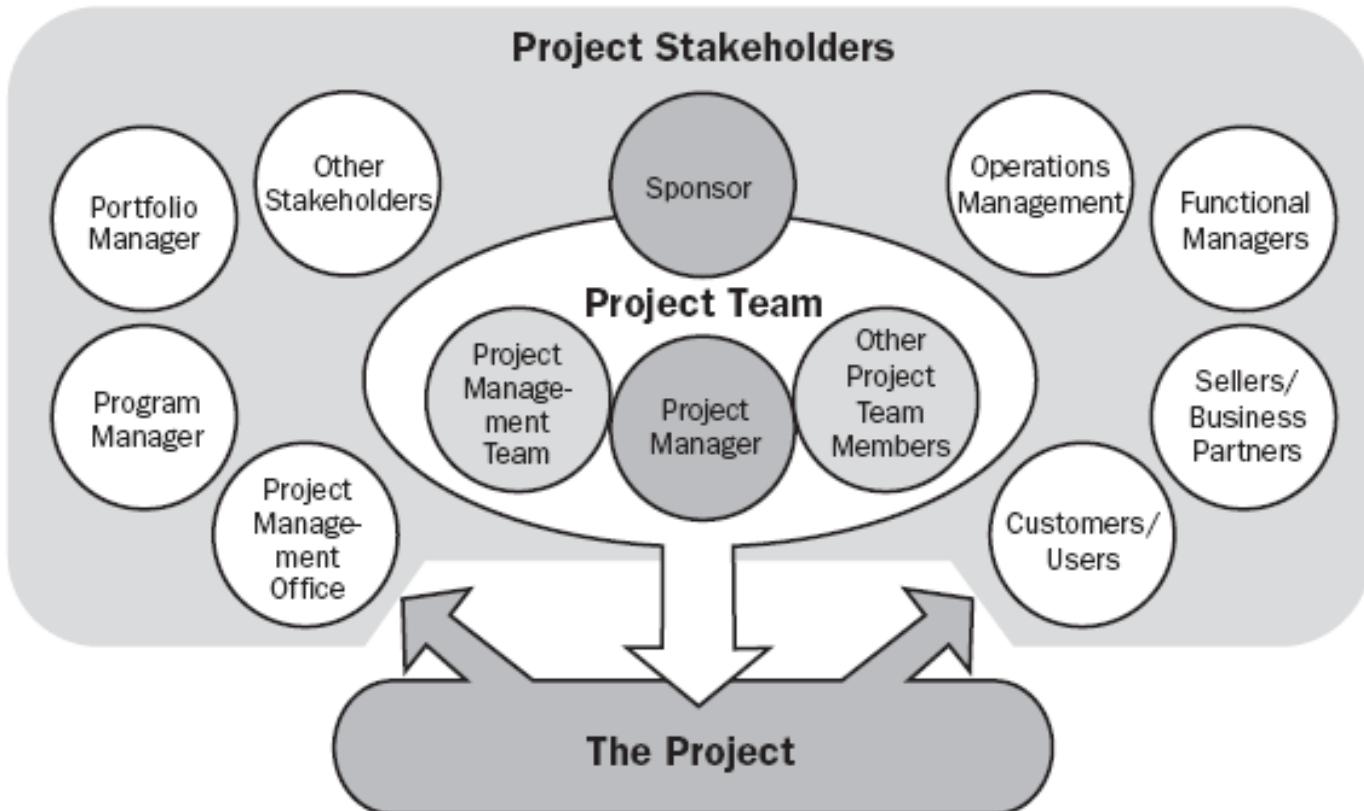

Who are Stakeholders?

Persons or organizations who are actively *involved* in the project or whose interests maybe positively or negatively *affected* by the performance or completion of the project

Who are Stakeholders?

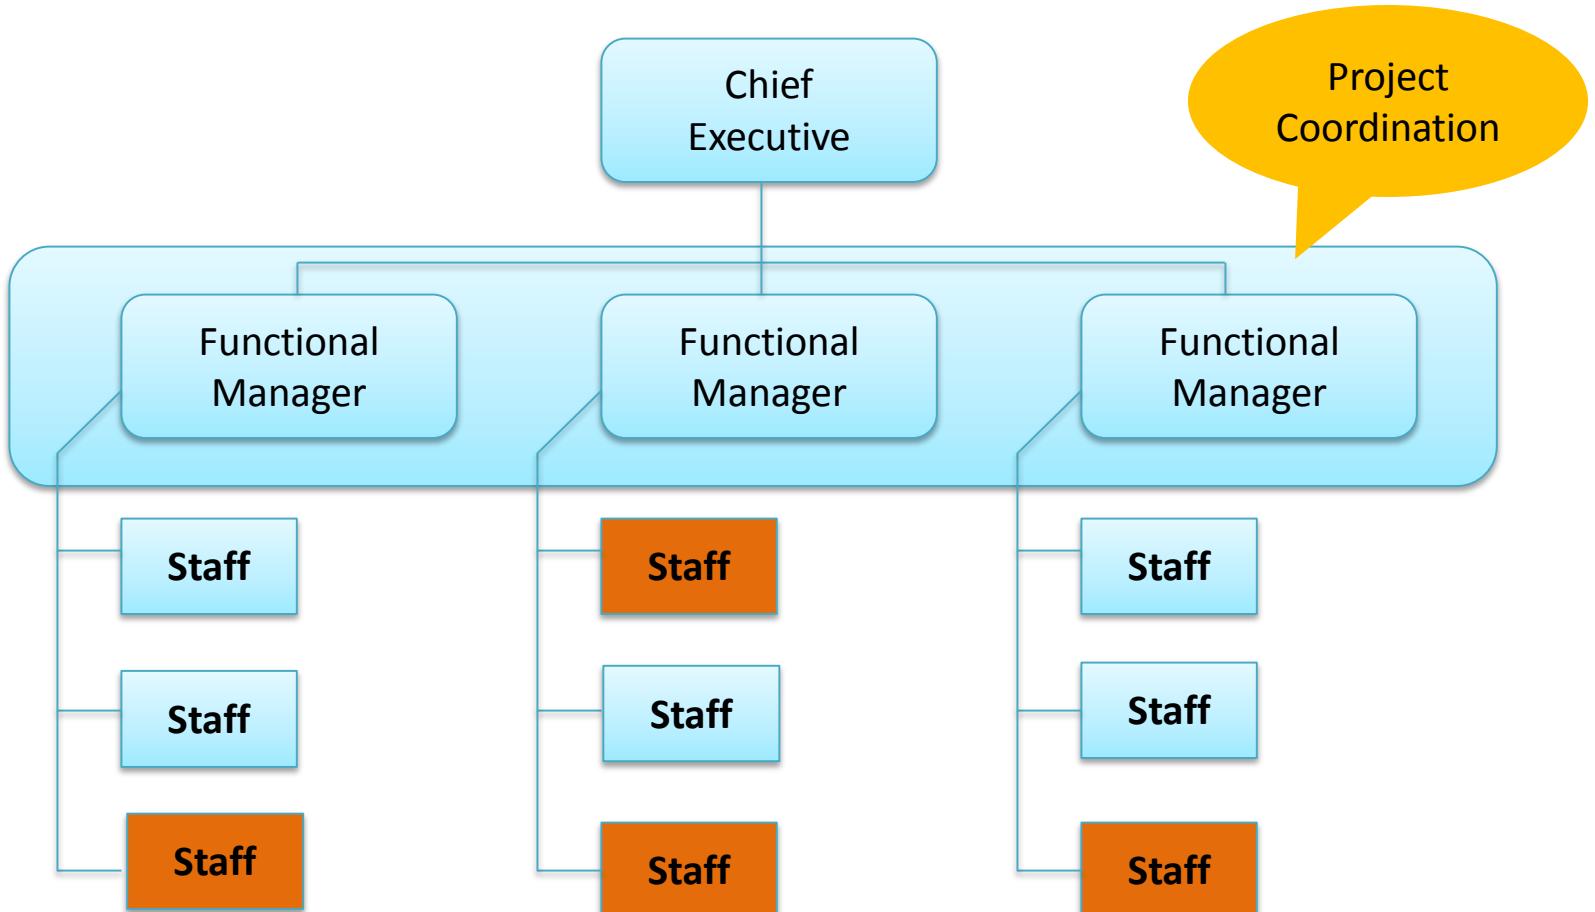

Project Life Cycle and Organization

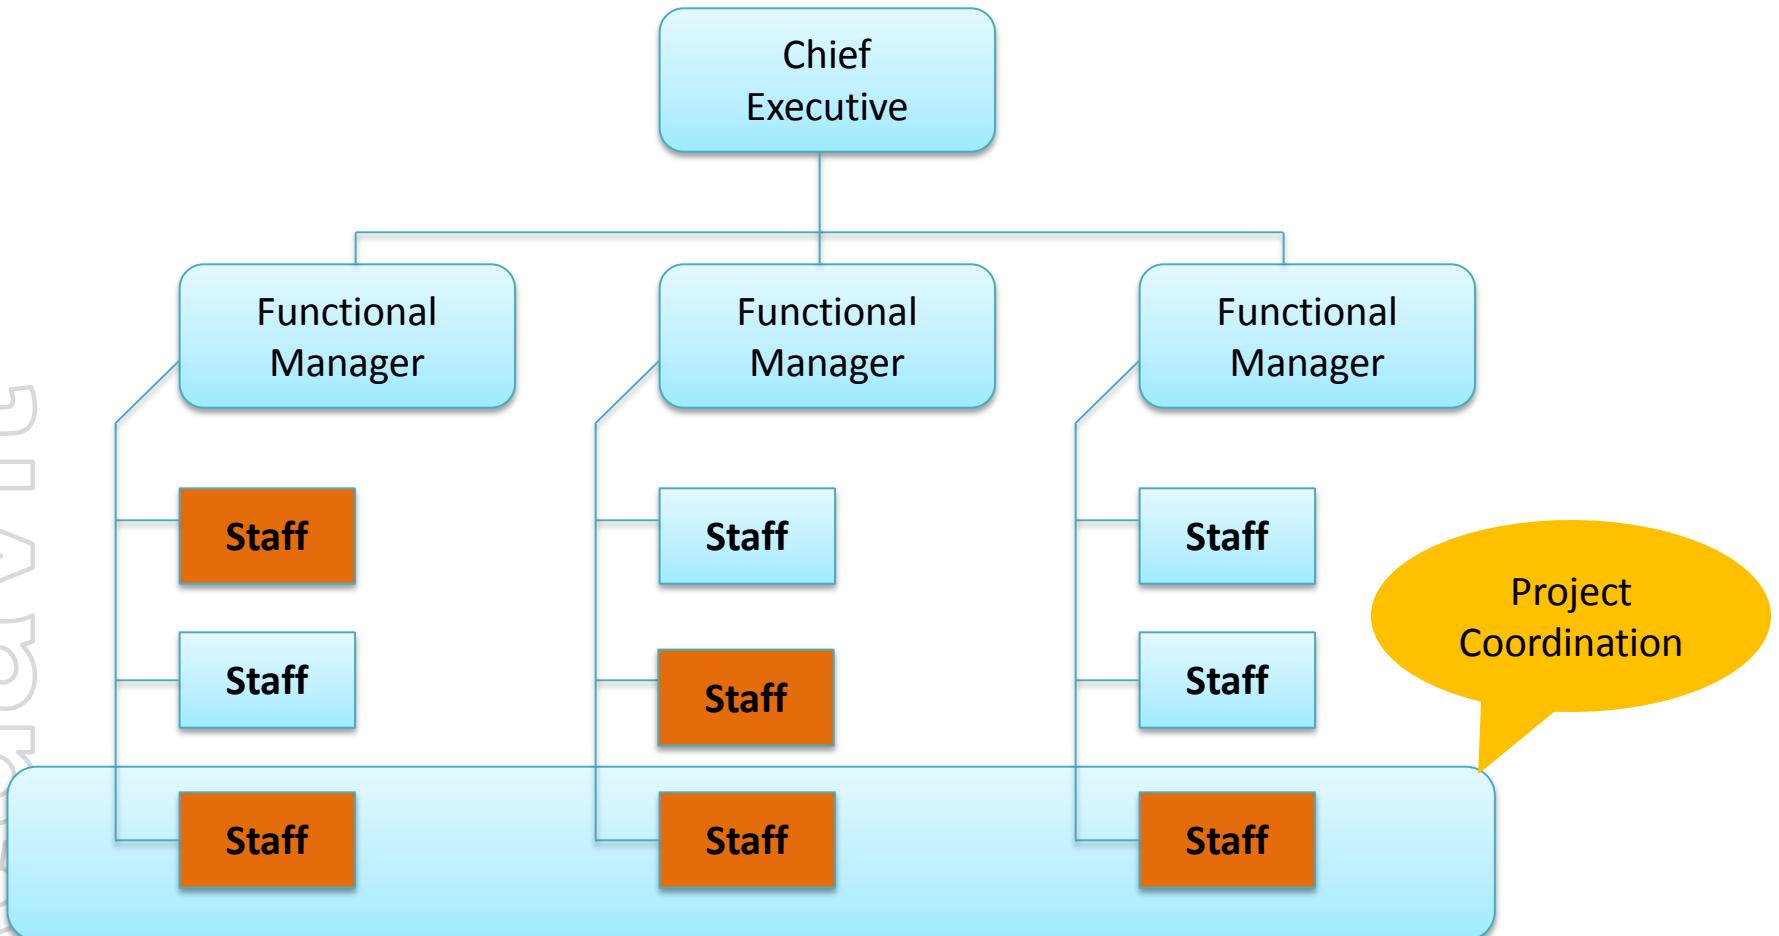

Organizational Types

- ✓ Functional
- ✓ Matrix
 - ✓ Weak Matrix
 - ✓ Balanced Matrix
 - ✓ Strong matrix
- ✓ Projectized

Functional

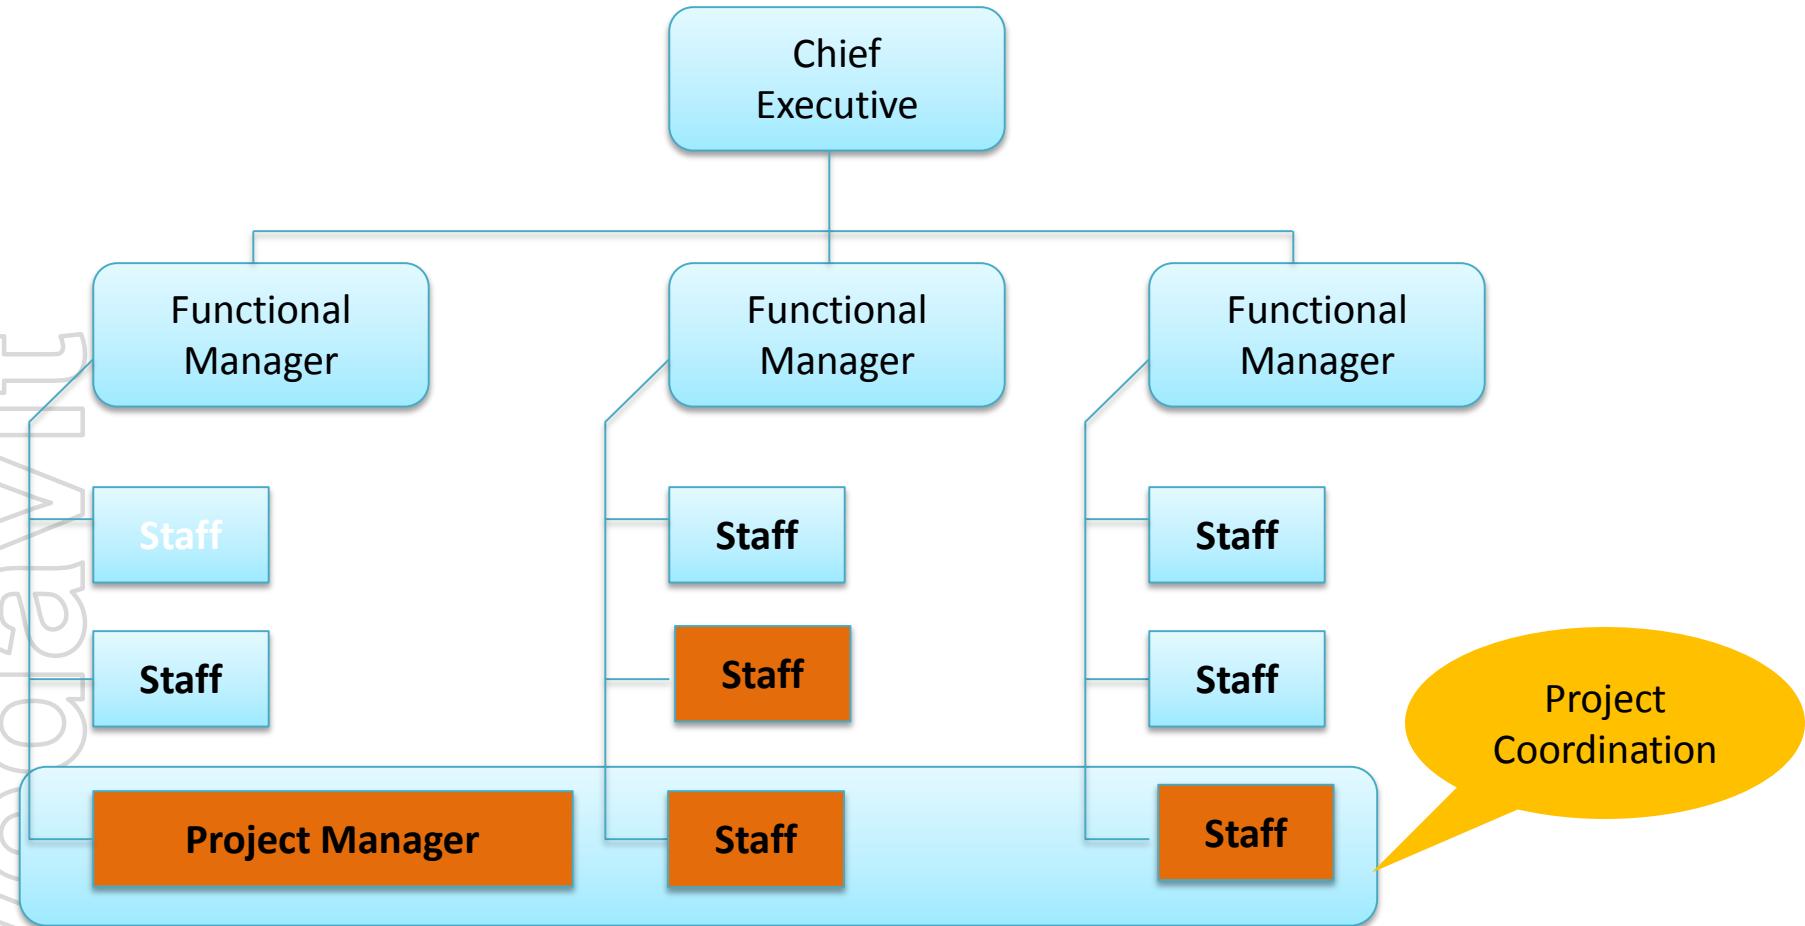

Weak Matrix

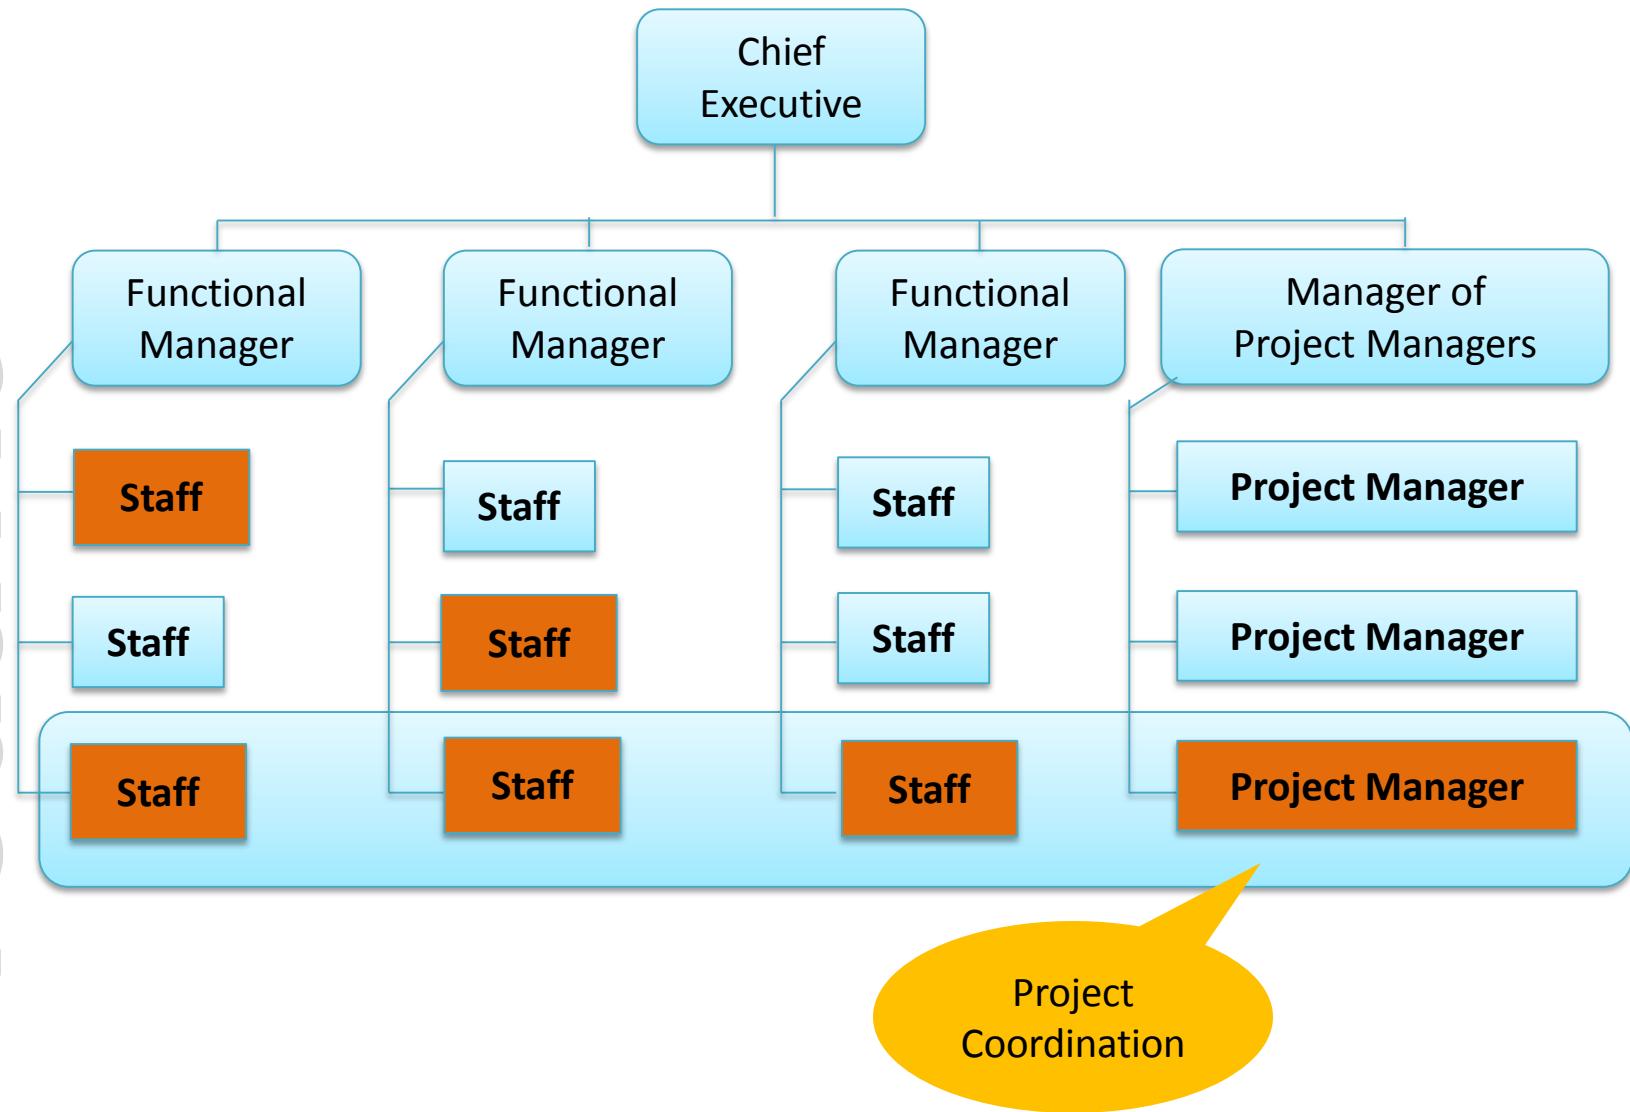

Balance Matrix

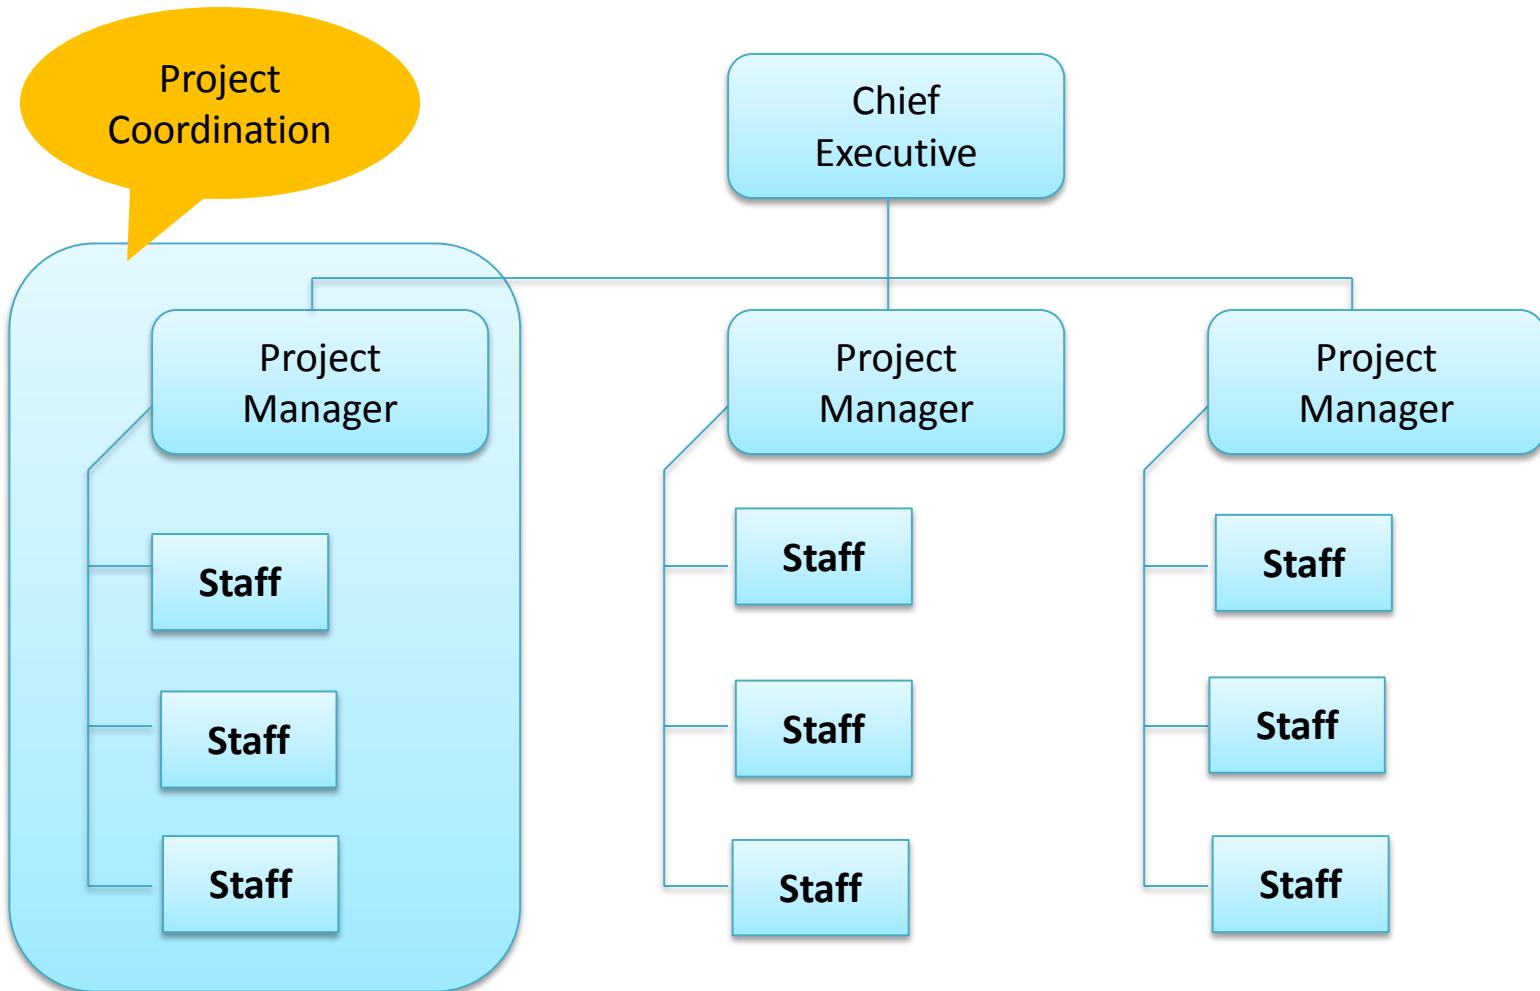

Vedavit

Strong Matrix

Projectized Matrix

Organizational Influence

Project Characteristics	Organization Structure	Functional	Matrix			Projectized
			Weak Matrix	Balanced Matrix	Strong Matrix	
Project Manager's Authority	Little or None	Limited	Low to Moderate	Moderate to High	High to Almost Total	
Resource Availability	Little or None	Limited	Low to Moderate	Moderate to High	High to Almost Total	
Who controls the project budget	Functional Manager	Functional Manager	Mixed	Project Manager	Project Manager	
Project Manager's Role	Part-time	Part-time	Full-time	Full-time	Full-time	
Project Management Administrative Staff	Part-time	Part-time	Part-time	Full-time	Full-time	

PM Competencies

Introduction / Project Management

Project Manager Competency Development
Framework- 2nd Edition, 2007

vedavit

Responsibilities of a Project Manager

- Estimates of size, efforts & schedule
- Risk identification, analysis, prioritization, monitoring & control
- Resource allocation, resource backup and utilization
- Scope management
- Communication- reviews, steering committee meetings, stakeholder identification and expectation management
- Stakeholder Expectation Management
- Defect free product delivery on time within budget
- Team motivation, team management, training & development, appreciation, career planning, interview
- Deliver as per contract & proposal
- Procure as per contract & proposal
- Configuration management, data backup
- Quality planning
- Cost optimization
- Presales & proposals
- Technical guidance to team – if team members are not available do their work (after project manager has completed his work & he has spare time)

In agile projects, project manager works as a servant leader, facilitator, impediment remover, watchdog for processes and firewall for the team

Responsibilities of a Project Manager

- **Initiating a Project**

- Project aligned with org objectives & customer needs
- High-level risks, assumptions and constraints are understood
- Stakeholders identified and their need are understood
- Project Charter approved

- **Planning a Project**

- Project scope agreed
- Project schedule approved
- Cost budget approved
- Project team identified with roles and responsibilities agreed
- Communication activities agreed
- Quality management process established
- Risk response plan approved
- Integrated change control processes defined
- Procurement plan approved
- Project Plan approved

Responsibilities of a Project Manager

- **Executing a Project**
 - Project scope achieved
 - Project stakeholders expectations managed
 - Human resource managed
 - Quality managed against plan
 - Material resources managed
- **Monitoring & Controlling a Project**
 - Project tracked and status communicated to stakeholders
 - Project change is managed
 - Quality is monitored and controlled
 - Risk is monitored and controlled
 - Project team managed
 - Contract administered
- **Closing a Project**
 - Project outcomes accepted
 - Project resources released
 - Stakeholder perceptions measured and analyzed
 - Project formally closed

Project Manager Competencies

- Communication
- Leading
- Managing
- Cognitive Ability
- Effectiveness
- Professionalism

 11. Agile Methodologies
 12. When Does Agile Methodologies Works Best?
 13. Agile Project Lifecycle
 14. Value Delivery & Project Life Cycle
 15. Agile practices vs PMBoK Processes

Before we go ahead...

Lets see one case study on agile project management

Modern Project Management Challenges

- Uncounted uncertainties
- Very tough to negotiate with stakeholders a change in baselined plan
- Product value realization at the end of project lifecycle
- Huge difference between expectations of end user, customer and sponsor
- Typically development team is isolated from business scenario and it becomes very difficult to implement change request
- Technology and project environment changes during project execution
- Customer does not want to hear about new timelines even after requirement changes. Because project is baselined!
- Customer end up paying more because critical dates missed, non-usuable product features, less-value product
- Not enough decentralized power stations to make decisions during project execution
- Execution team and project management teams are different. Execution team does not have power and execution does not happen as per initial plan
- Work product delivered at the end of every phase is not usable work product. Typical it is some paper prototype, document or some other thing.

How to address modern day PM challenges?

- Involve end user
- Engage relevant stakeholders
- Produce in increment
- Deliver high value feature first
- Take frequent feedback and allow customer to change original requirements
- Allow customer to prioritize
- Get commitment from team for valuable product not of activities
- Employ the power of level of planning
- Involve team in risk identification and responding to risk
- Transparency in project management
- Continuous improvement
- Learn quickly

Challenges in Starting Agile Project Management

- Team
 - Getting experienced team member
 - Getting 100% committed team
 - Getting collocated team in early agile adoption
 - Team's mindset shifting from action to delivery
 - A cross disciplined team with generic skills
- Environment
 - Trust building
 - Open communication with customer
 - Keeping politics out
- Infrastructure & Support
 - Active risk management framework
 - Robust, flexible and adaptable configuration and data management systems
 - You need a variety of **communication, collaboration, management and development tools.** Therefore a culture is required to support and facilitate this endeavors.
 - Management need a framework from where they get to know what is happening in the project.
 - Upfront training
 - Supporting in early period when velocity is less

What is Agility?

- Agility is about quickly responding to changes
- Learning quickly from mistakes and incorporate lessons learned
- Being proactive
- It helps in all aspects of success- Personal, Technical and Organizational

Vedavit

What is Agility?

- How agility is possible with complex, bureaucratic, gigantic processes.
- Traditional processes are reactive in nature, they learn very late, respond very slow

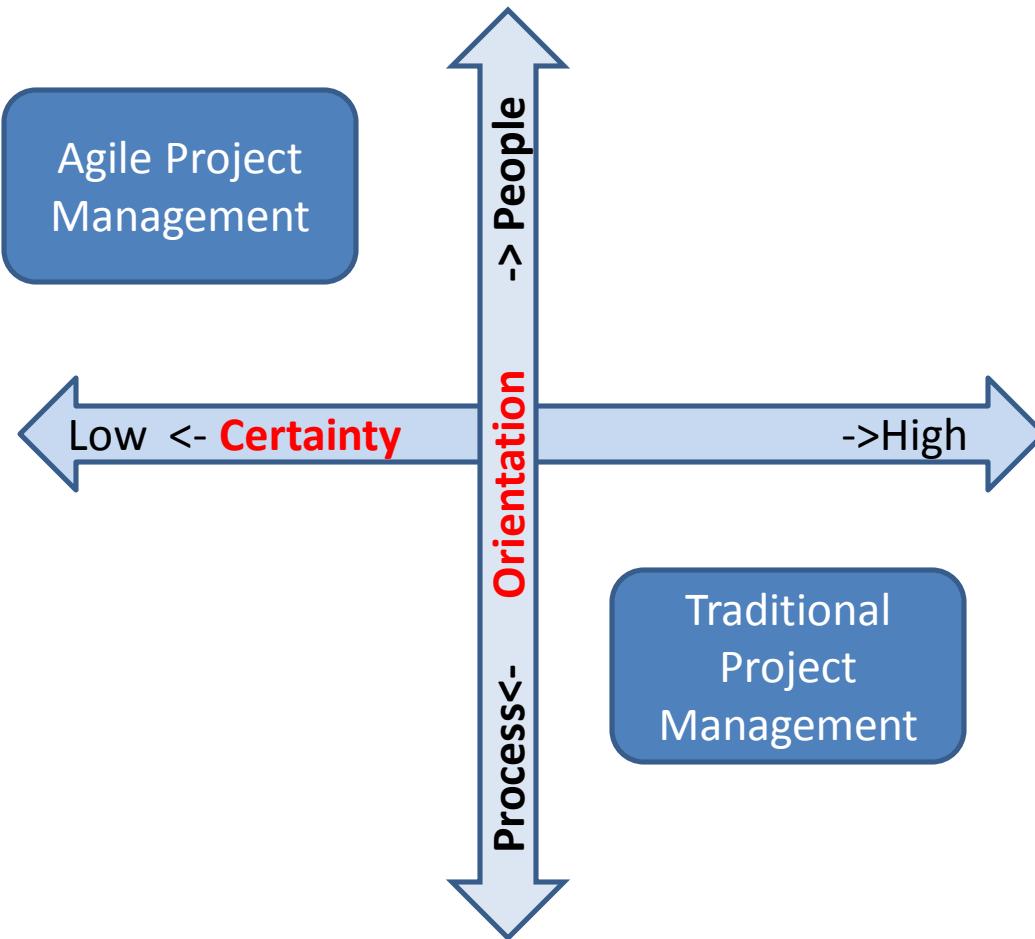

vedavit

What is Agility?

- This refinery along with township in Jamnagar, Gujarat, India was completed in 1999 in 36 months.
- There was the time when over 100,000 people working on the project on any particular day and sponsor was paying rental for a crane Rs 10 million every day.

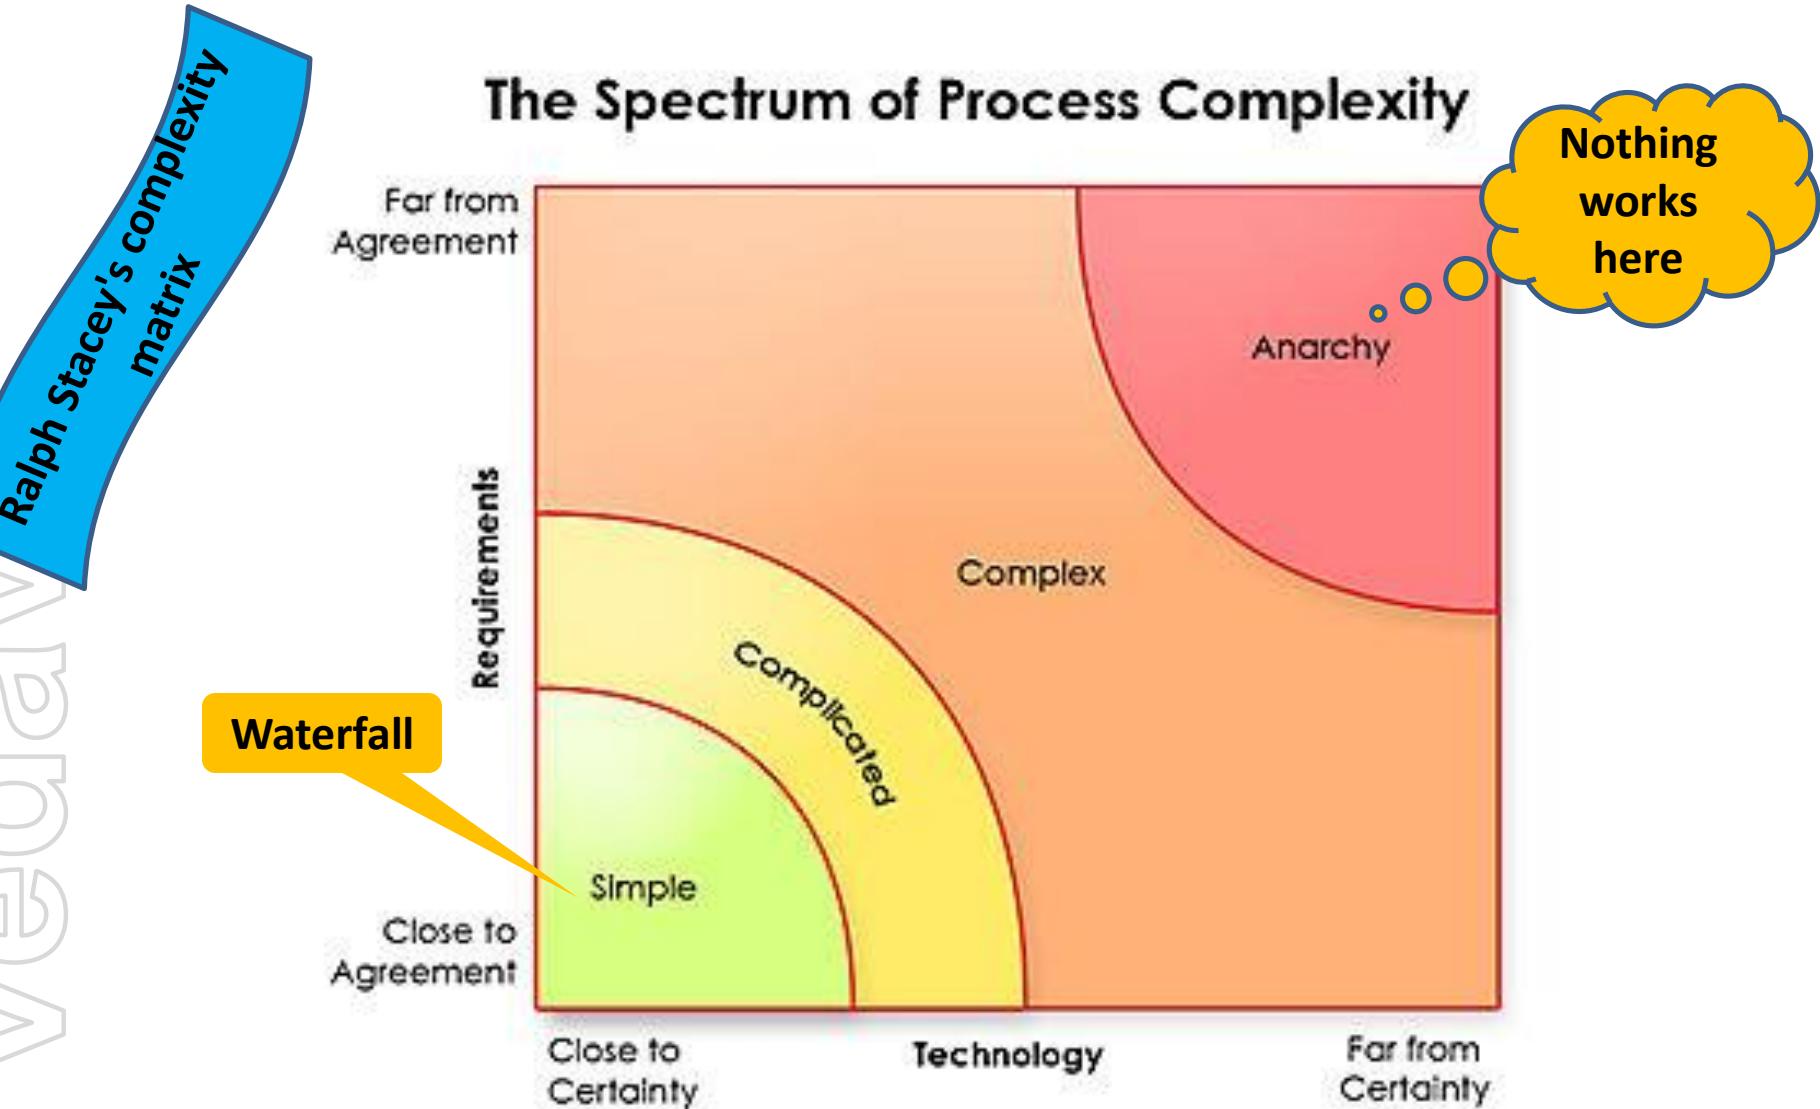

Which PM Methodology is best?

Which PM Methodology is best?

Vedavit

Types of Systems

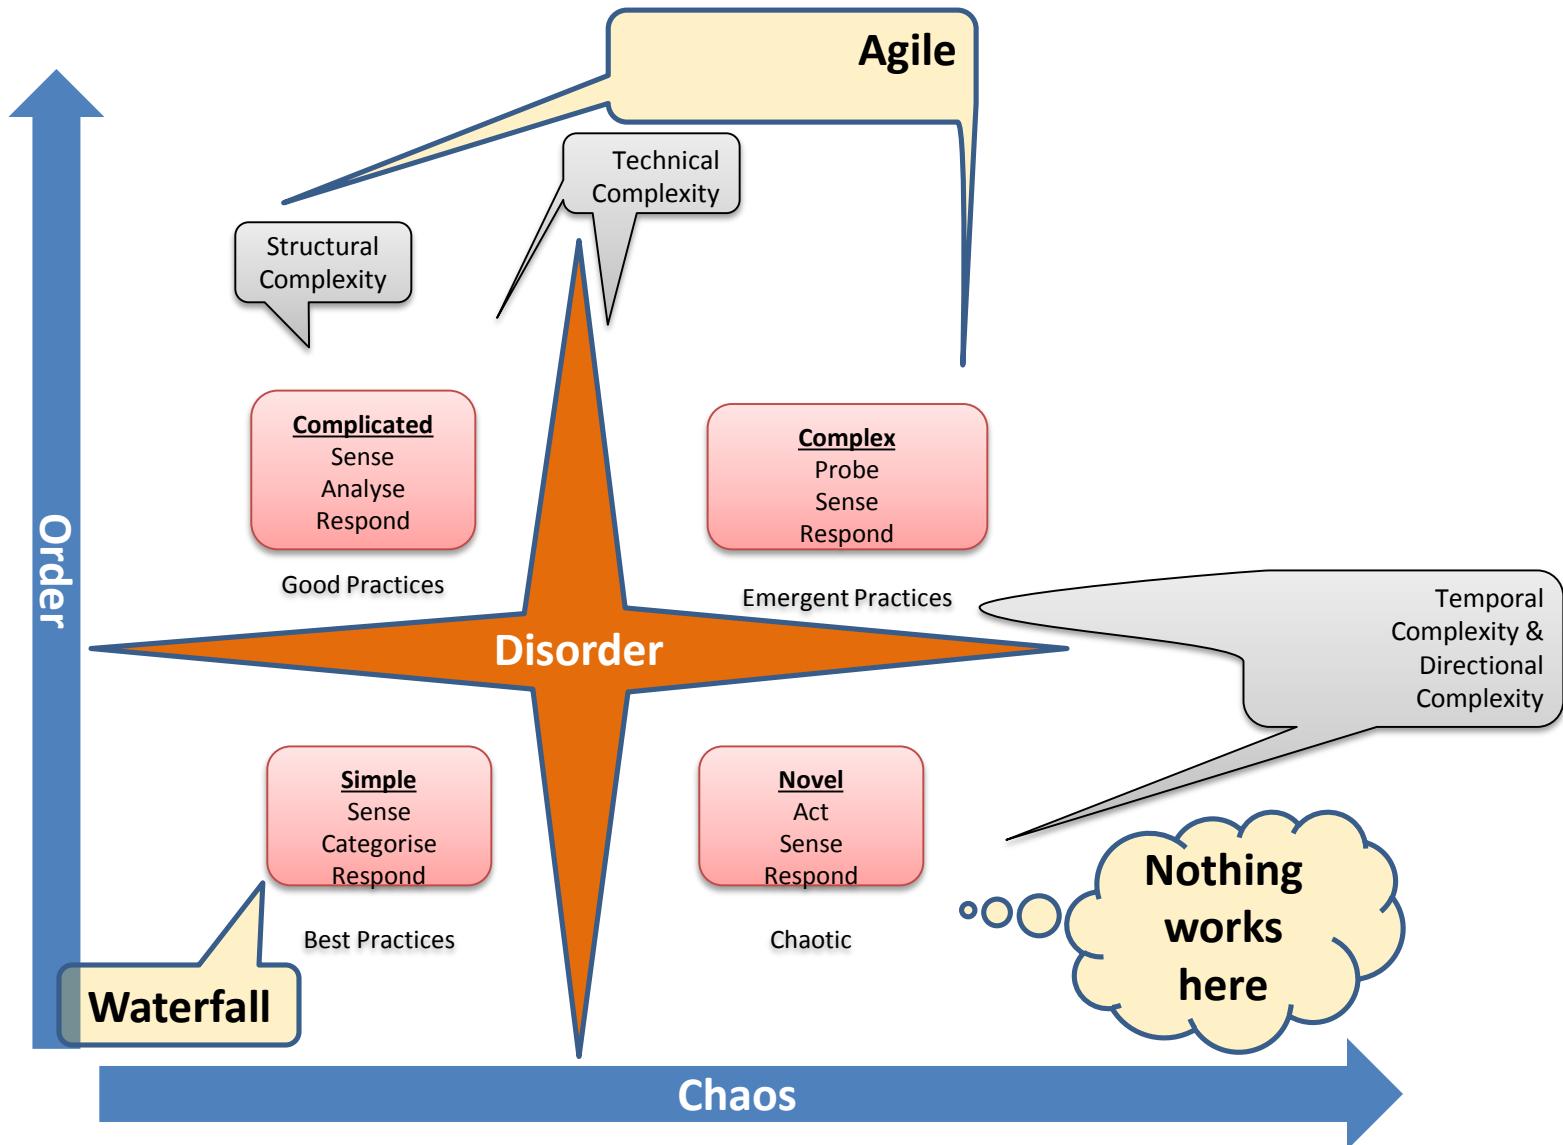

Act	Probe	Sense	Analyze	Categorize	Respond	
✓		✓			✓	Chaotic
	✓	✓			✓	Complex
		✓	✓		✓	Complicated
		✓		✓	✓	Simple

Vedavit

Types of Systems

- In your kitchen you need to make tea but you realized there is no water, milk, tea bag, sugar! First you need to sense. Then categorise to solve.
 - Best practices will help here. No change is required in practices. **Simple.**
- Your school going boy is not interested in going school but you want him to go. First you need to sense the problem.
 - Good practices learned from your elders and friends will help you here. Little tailoring may be required. **Complicated**
- As a head of department you want to remove corruption from your department. First you need to probe.
 - Practices keep emerging. **Complex.**
- Bus, Scooter, Cycle, Tram, Car, Pedestrian using the same road to commute is chaos. First you need to act.
 - No practice helps here. **Chaotic.**

Types of Systems

Complex Adaptive Systems

- Think about how newly born child is going to learn about talking, walking, learning, eating etc.
- What process you use to climb mountain?
- In the last couple of decades scientists and managers have articulated a profound shift in their view about how organisms and organizations evolve, respond to change, and manage their growth.
- Complex Adaptive Systems theory is one of the root threads of agile development. The concepts about how biological systems evolve and adapt have relevance, if only metaphorically, to organizations and how they evolve and adapt.
- Creativity and innovation are the emergent results of well-functioning agile teams.
- In complex system things get done because people adapt not because they blindly follow
- Former Visa International CEO **Dee Hock** coined the word “**chaordic**” to describe both the world where Order exists in Chaos.

Defined vs Empirical Processes

Defined Processes

- Assumes that every piece of work is completely understood
- Input is well-defined
- A set of well-defined input produces same output every time within known variance limit
- Has tightly coupled steps
- No checkpoint and feedback steps

vedavit

Defined vs Empirical Processes

Empirical Processes

- Relies on frequent inspections and adaption
- Applies to those process which are loosely defined because of their complexity
- Understand that output of a process can be unpredictable and unrepeatable

vedavit

Value in Agile Manifesto

“We are uncovering better ways of developing software by doing it and helping others do it. Through this work we have come to value”

- **Individuals and interactions** over processes and tools
- **Working software** over comprehensive documentation
- **Customer collaboration** over contract negotiation
- **Responding to change** over following a plan

That is, while there is value in the items on the right, we value the items on the left more.

www.agilemanifesto.org

Agile Principles

- 
1. Satisfy customer by continuous delivery of valuable product
 2. Welcome Change even at late stage
 3. Deliver working software Frequently
 4. Business and Developer work together
 5. Build around Motivated Individuals- Give team opportunity, trust them
 6. Face-to-face communication
 7. Working software is the primary measure of progress.
 8. Sustainable Development
 9. Continuous Technical Excellence
 10. Simplicity--the art of maximizing the amount of work not done--is essential.
 11. Self Organizing Team
 12. Team reflection at regular intervals

www.agilemanifesto.org

Agile Core Practices

- 
1. Active Stakeholder Participation
 2. Apply the Right Artifacts
 3. Collective Ownership
 4. Create Several Models in Parallel
 5. Create Simple Content
 6. Depict Models Simply
 7. Display Models Publicly
 8. Iterate to Another Artifact
 9. Model in Small Increments
 10. Model with Others
 11. Prove it with Code
 12. Single Source Information
 13. User the Simplest Tools

Agile Characteristics

- Adaptability not Predictability
- Accepting that outcomes are not predictable and process are not repeatable
- Values and Principles of Collaboration
- The conventions which we agree we define those
- Processes are in manuals; practices are in field.

Vedavit

Agile Methodologies

- 
1. Scrum
 2. Extreme Programming (XP)
 3. Lean Software Development (LSD)
 4. Feature Driven Development (FDD)
 5. Dynamic System Development Methods (DSDM)
 6. Kanban
 7. Scrum-Ban
 8. Crystal Methods

Agile Methodologies- Scrum

Introduction / Agile Project Management/ Agile Methodologies

- Scrum is widely accepted agile project management methodology among dozen of methodologies.
- Scrum is **lightweight management framework** with broad applicability for managing iterative and incremental projects of all type of projects
- Typical iteration (also called “**Sprint**”) length varies between 2-4 weeks.

Scrum Values

1. Commitment
2. Focus
3. Openness
4. Respect
5. Courage

Agile Methodologies- Scrum

Introduction / Agile Project Management/ Agile Methodologies

Scrum Practices

- Backlog Grooming
- Sprint Planning
- Daily Standup
- Sprint Review
- Sprint Retrospective

Vedavit

Agile Methodologies-XP

Introduction / Agile Project Management/ Agile Methodologies

Originally devised by Kent Beck as an agile method focused on engineering practices. Typical iteration length varies between 1-3 weeks.

XP Values

- 
1. Communication
 2. Simplicity
 3. Feedback
 4. Respect
 5. Courage

Agile Methodologies- XP

Introduction / Agile Project Management/ Agile Methodologies

XP Practices

Fine scale feedback

1. Test Driven Development via Programmer Tests and Customer Tests (Unit Tests & Acceptance Tests)
2. Planning Game
3. Whole Team (including on-site customer)
4. Pair Programming (2 people sitting on one work station, one writing test case on notes and another writing code)

Continuous process rather than batch

5. Continuous Integration
6. Design Improvement / Refactoring
7. Small Releases

Agile Methodologies- XP

XP Practices

Shared understanding

- 
8. Simple Design (Do Simple Things, You Aren't Gonna Need It (**YAGNI**), Once And Only Once (**DRY**), Simplify Vigorously)
 9. System Metaphor
 10. Collective Code Ownership
 11. Coding Standard or Coding Conventions

Programmer welfare

12. Sustainable Pace

Agile Methodologies- LSD

Introduction / Agile Project Management/ Agile Methodologies

Much of its principles and practices are from Lean Enterprise Movement and companies like Toyota

Lean Software Development (LSD) 7-Principles

1. Eliminate Waste (Just in Time –JIT, Kanban)
2. Amplify Learning
3. Decide as late as possible (Make a decision when not making it means leaving some important option)
4. Deliver as fast as possible
5. Empower the team
6. Build Integrity In (overall experience of system quality, product quality should be dependable)
7. See the whole (see big picture)

Agile Methodologies- FDD

Introduction / Agile Project Management/ Agile Methodologies

- FDD is a model-driven, short-iteration method
- First step is to establish an overall model shape
- Followed by 2 week “design by feature, build by feature” iterations.

vedavit

Agile Methodologies- FDD

Introduction / Agile Project Management/ Agile Methodologies

Eight practices of FDD

1. Domain Object Modeling
2. Develop by Feature
3. Component/class ownership
4. Feature Teams
5. Inspections
6. Configuration Management
7. Regular Builds
8. Visibility of Progress and Results

Agile Methodologies- DSDM

- Earlier in 1994 it was known as RAD method
- Previous version of DSDM is 4.2, that was released in 2003. Latest version of DSDM released in 2007 is also called **DSDM Atern**
- DSDM Atern used MoSCoW principle to prioritize requirements
- It is compatible with ISO9000 and PRINCE2
- “Fitness for business purpose” is primary criteria for delivery and acceptance of system
- It focuses that 80% of the system can be developed in 20% of the time

Agile Methodologies- DSDM

Introduction / Agile Project Management/ Agile Methodologies

8 Principles of DSDM

1. Focus on the business need
2. Deliver on time
3. Collaborate
4. Never compromise quality
5. Build incrementally from firm foundations
6. Develop iteratively
7. Communicate continuously and clearly
8. Demonstrate control

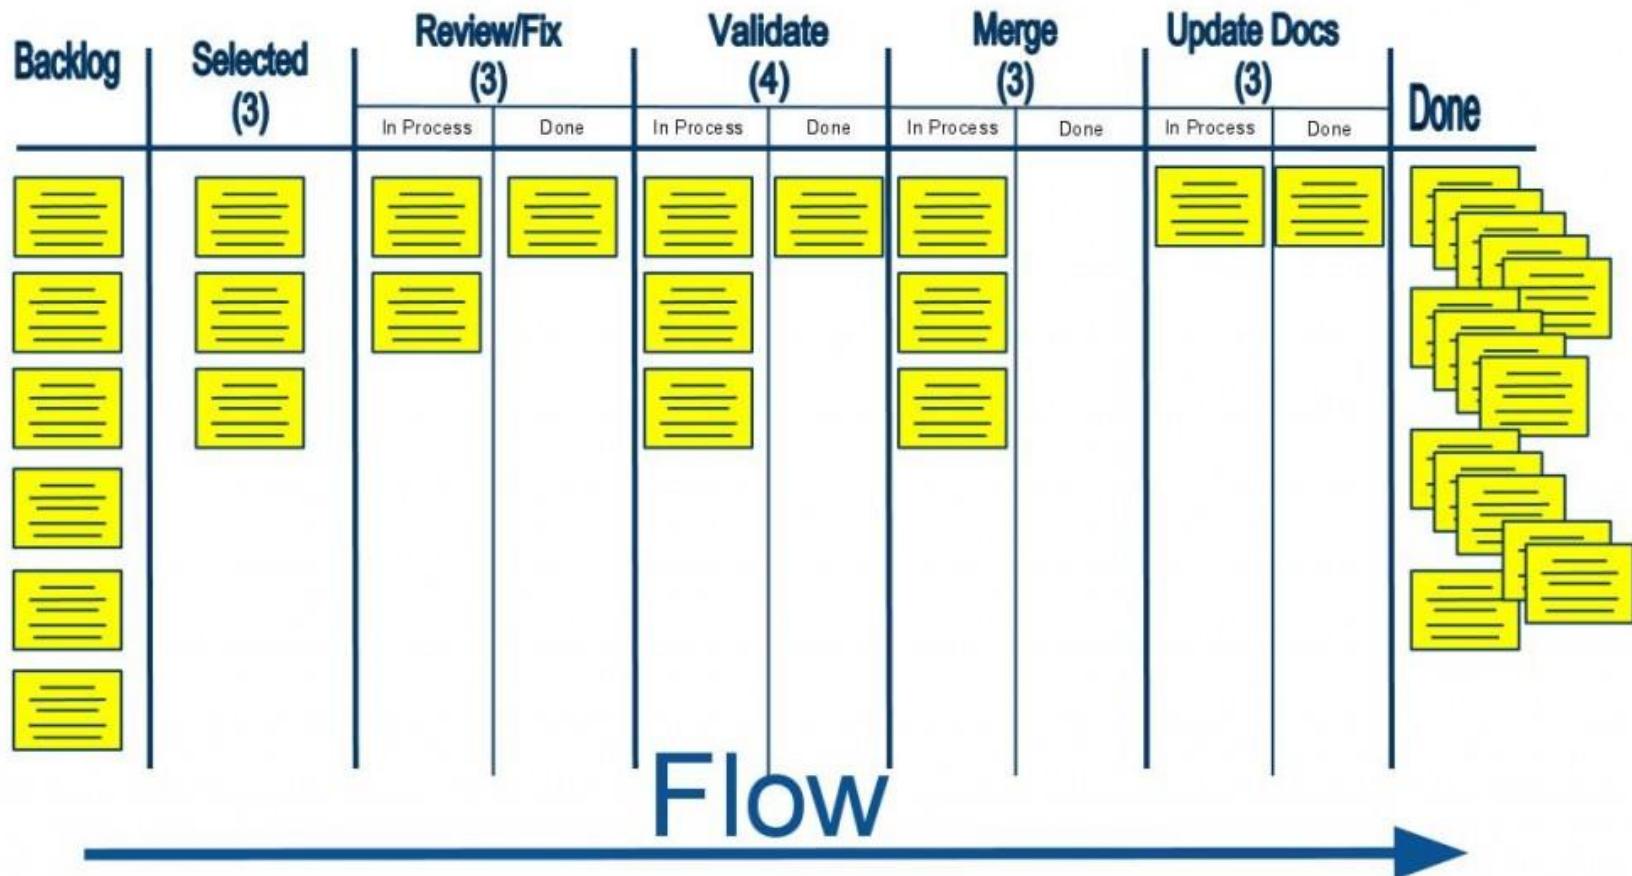

Agile Methodologies- Kanban

Introduction / Agile Project Management/ Agile Methodologies

- In Japanese Kanban means Sign-Board
- Kanban was developed by Taiichi Ohno, at Toyota, to find a system to improve and maintain a high level of production.
- Kanban is scheduling system for Lean and JIT production.
- Kanban is one method through which JIT is achieved.
- Kanban is pull based planning and execution method. Work is not planned and pushed into work queue of team. Team signals when they are ready to take more work and pulls into their queue. Uses cards to signal the need of items
- Under Kanban or Lean approach queues or inventory of work in any state is seen as waste.
- **WIP limits:** helps team in optimal flow of work items, minimizing any associated waste
- Allow team to achieve process optimization while respecting and maintaining sustainable pace.

Kanban Board

Vedavit Project Solutions

Agile Methodologies- Scrum-ban

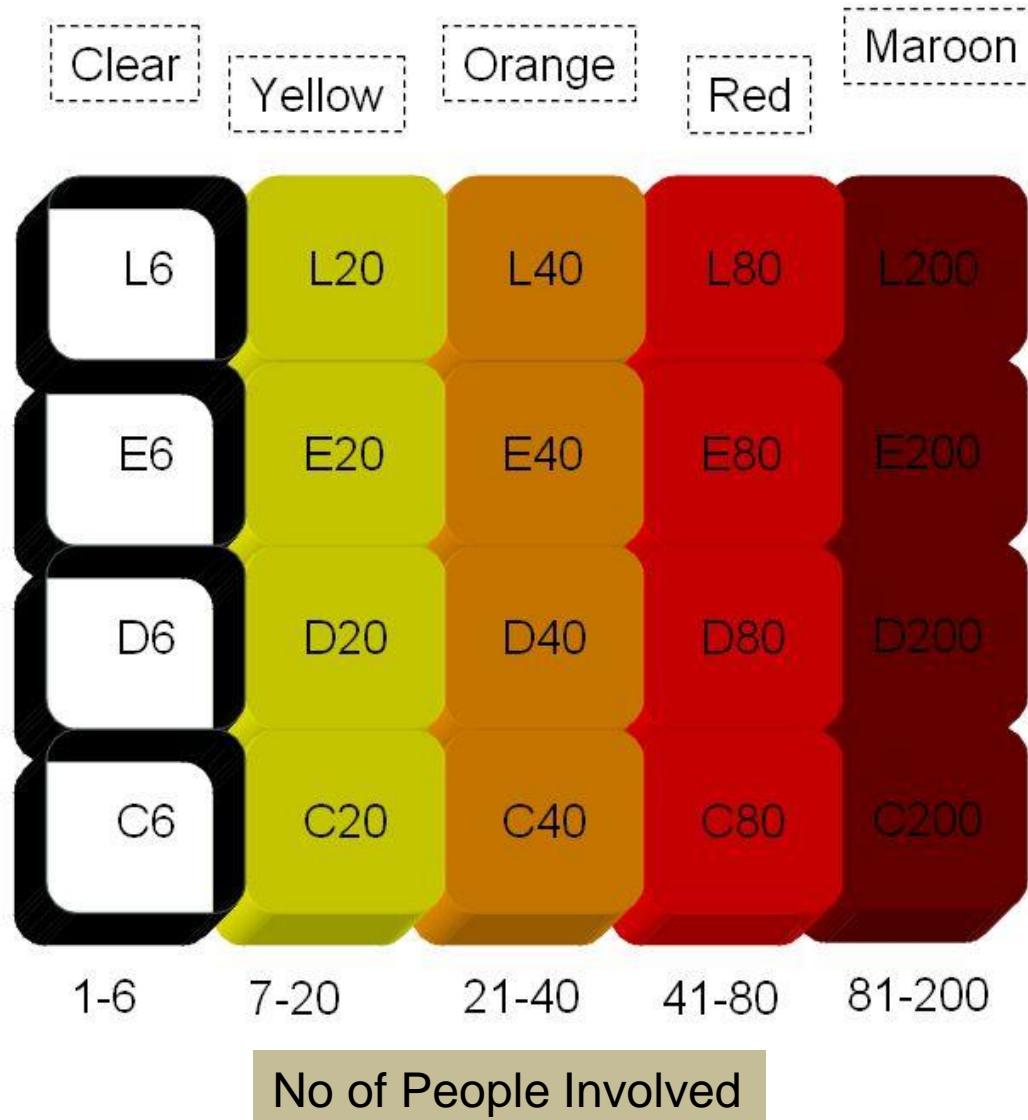

- Scrum-ban is a software production model based on Scrum and Kanban
- Scrum-ban is especially suited for maintenance projects or (system) projects with frequent and unexpected user stories or programming errors. Thus time-limited sprints of the Scrum model are of no appreciable use.
- Scrum's daily meetings and other practices are highly useful
- Visualization of the work stages⁽¹⁾ and limitations for simultaneous unfinished user stories⁽²⁾ and defects⁽³⁾ are part of the Kanban model.
- The team's workflow is directed in a way that allows for minimum completion time for each user story or programming error, and on the other hand ensures each team member is constantly engaged.

Agile Methodologies- Crystal

- Crystal is one of the most light-weighted software development methodology
- Crystal is a family of methodology. Family members are Crystal Clear, Crystal Yellow, Crystal Orange etc.
- Which type of crystal methodology should be used for a particular project depends upon **criticality of the project** and **number of people involved**
- This methodology relies on the fact the processes can be tailored based on unique characteristics of the project

Agile Methodologies- Crystal

Criticality, Defect cause ...

When does Agile Methodologies Works Best?

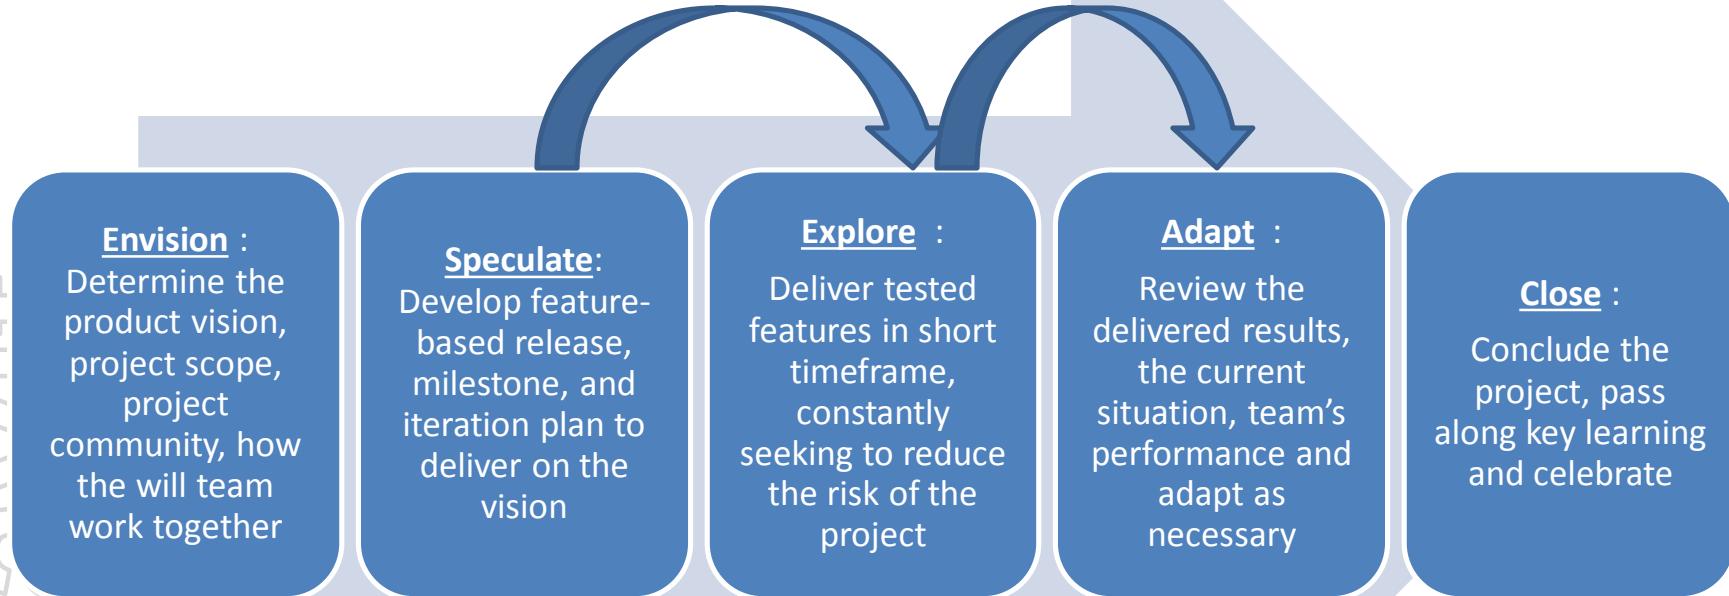

- When problems you are solving have following characteristics
 - Going to **change** while solving
 - **Speed** of development cannot be determined
 - **Turbulence** in environment
 - Customer **doesn't know** how exactly it will look like

vedavit

 15. Agile Health Checkup

Iteration / Sprint

- Agile project management relies on planning, developing and delivering product features in iterations
- Iteration or sprint are time-boxed and duration can not changed from one iteration to another
- Iteration is fixed time period in which team need to deliver some valuable product to customer
- Prescription for duration length varies from one method to another in agile. In XP iteration length varies 1-3 week (typically one week), scrum and other methods it varies between 2-4 weeks (typically 4 weeks)
- Iteration is also known as Sprint in Scrum Methodology

V
e
d
a
v
i
t

Incremental Delivery

Delivering the complete product of a project in iterations. It helps in

- Learning from previous iteration
- Delivering high business value earlier
- Adapt to change
- Delivering more business value
- Removing the waste by not doing those things which are not needed

Travel Light

- You need far less than what you think.
Therefore carry on only those things which are most important and urgent.
- YAGNI (You aren't gonna need it)
- TAGRI (They aren't gonna Read It)

This is different type of mountaineering. You may need to come back, you may need to change your path, trust that you will get stuff you need on the way etc factor exists here.

Agile Product Building

- Build complete product, all the time
- One button should produce needed documentation, build the product executables, create installation materials, produce test results and tested components
 - Build should also work from command line
 - Everyone in team should use the same build process

vedavit

Agile Documentation

- Maximize stakeholder investment. Produce document only when
 - It is needed by a stakeholder
 - Needed to define contract model
 - You need to think something in many iterations involving multiple groups
 - It is needed for external communication
- Document only those things which are least likely to change
- First identify the specific customer of the document
- The document facilitates in estimating
- Sufficiently index, details, accurate and consistent

Agile Documentation

Strategies for reducing documentation CRUFT

- C- How correct is document?
- R- Will document be read?
- U- Will document be understood?
- F- Will document be followed?
- T- Will document be trusted?

Agile Architecture

- Do the simplest thing possible which makes future changes/additions easier
- No up-front high-level system architecture
- No up-front high-level component architecture
- No up-front high-level data model
- Determine the details of technology when building functionality

Vedavit

Agile Testing

- All code must have test cases, ideally they should be created earlier
- Unit tests should be executed during automated build
- A build should be performed many times a time, ideally whenever anything is checked-in or committed to configuration server
- If anybody's code causing crash he should be informed immediately and that person should fix that problem first
- All unit test must pass before code can be released

Vedavit

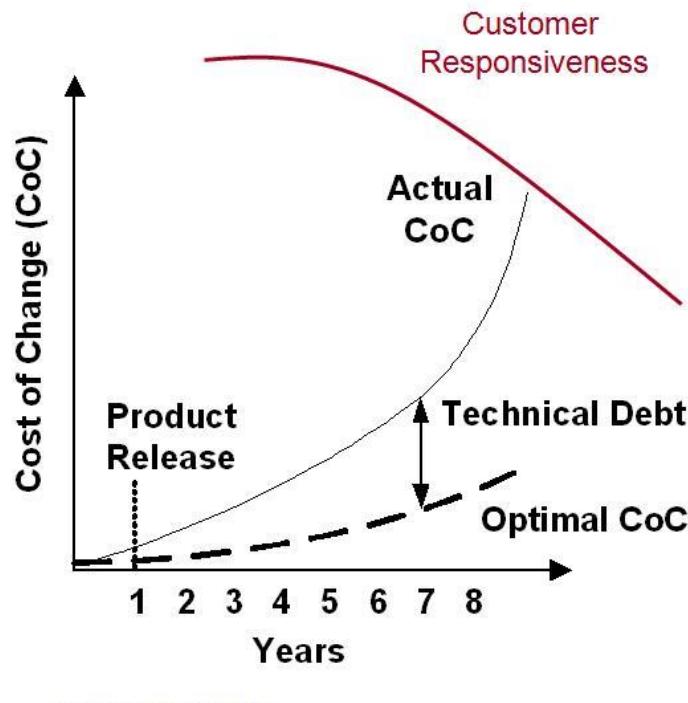

Last Responsible Moments

- Delay the decisions till the moment you have option to exercise because after this point one important options may be eliminated
- It helps you in delivering more value in less time by doing only those things which are of high priority
 - It reduces inventory carrying cost
 - Getting more information and making more informed decision at last moment

vedavit

Refactoring

- Agile programmer writes simple and bare minimum code they do not complicate the code
- Down the line structure the code without changing its behavior. It helps in improving the quality (maintainability, readability) of code

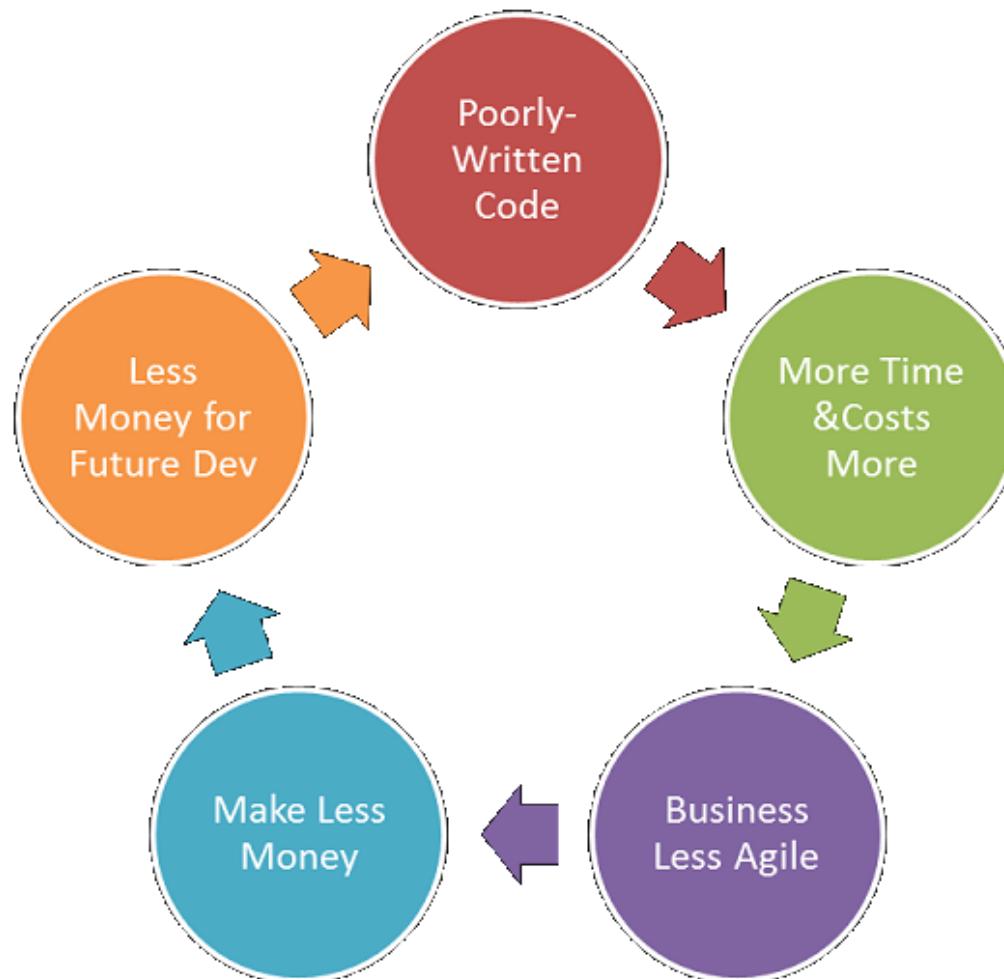

- Once on far right of curve, all choices are hard
- If nothing is done, it just gets worse
- In applications with high technical debt, estimating is nearly impossible
- Only 3 strategies
 - Do nothing, it gets worse
 - Replace, high cost/risk
 - Incremental refactoring, commitment to invest

Technical Debt

- While writing code agile programmer do not pay attention to structure, duplication etc but to functionality and make sure that code is passing all unit test cases
- In this process if they do not clean the code by structuring (refactoring) it will become unreadable and un-maintainable and over a period of time this cause increases response time to fix the problems, adding new feature and deteriorate the quality.
- The concept of unclean code is called technical debt. Technical debt keep increasing over the period of time therefore Agile team need to pay this debt back by putting efforts in refactoring.

Technical Debt

Vicious Cycle of Technical Debt

Mindfulness

- Agile team need to be conscious all the time, they need to keep observing patterns and proactively resolving the issues at root.
- **For example** if they know that now it is taking more time to add even simple thing in existing code then it means time has come and they need to pay technical debt by refactoring

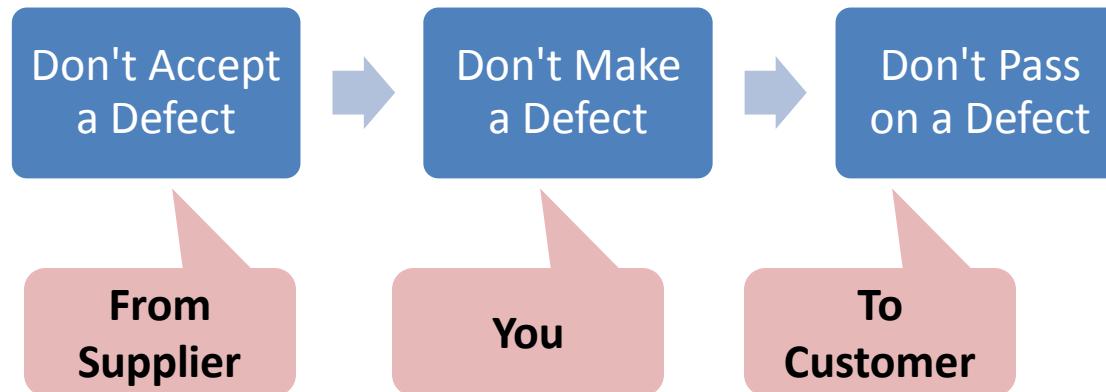

vedavit

Energized Work

- Love your work: When you feel that I enjoy programming. I enjoy solving problems, writing good code, watching tests pass, and especially removing code while refactoring. I love to program in my spare time and sometimes even think about work in the shower. You love your work
- Do not work overtime, enjoy balanced life, remain healthy, energetic and excited about work
- When at work completely cut off from interruption like phone, email, IM etc. Pay 100% attention to work at hand
- If you are making more mistake than progress then that is the time for break.

Poka Yoka

Mistake (Error) Proofing

Ideally, design the product so that it can't be assembled incorrectly

Error is deviation from process. Defect is in product who is deviating from specification or don't meet customer expectations. Defect are introduced by errors

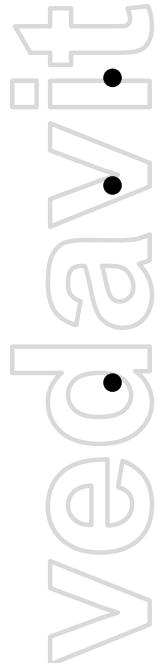

Agile Roles

- Pigs vs Chickens
 - Pigs are those roles which are committed
 - Chickens are those roles which are involved
- Product Owner
 - Grooms product backlog, interface between product user and team
 - Prioritizes requirements based on value
 - Has authority to change requirement, reject product
 - Justify the importance of product and its features
- Scrum Master
 - Process owner, ensures that stakeholders follow the processes
 - Removes impediments
 - Works as a servant leader
- The Team
 - Includes architect, developer, tester, UI Designer
 - Cross functional multi skilled team
 - Responsible for quality of the product

Agile Roles

- **Agile Tester**

- Try to identify if a user does not do what he is suppose to do then what happens to the software? Report it.
- Helps customer, product owner in writing acceptance test cases

- **Coach:** Identify and Improve work habits

- **Interaction Designer:** Learns and decides how users will interact with system.

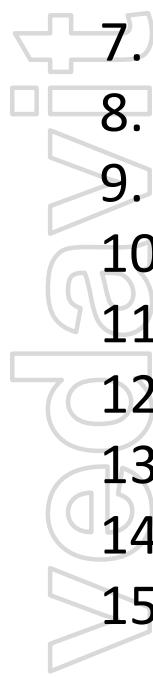

- **SME (Domain Expert):** Understands the business domain, regulatory requirements and defines business rule for the product

Agile Health Checkup

To know the agile maturity in your project you can perform following Agile Health Checkup. Discuss in group and ask team to rate these parameters on the scale of 1-5

- 1. Frequent Delivery**
- 2. Reflective Improvement**
- 3. Close Communication** (does it take less than 1 min to get your question answered by a person who know the answer?)
- 4. Focus** (everybody understand the goal and desired outcome of the delivered software?)
- 5. Personal Safety** (can you give bad news to your boss?)
- 6. Easy Access to Outside Experts**
- 7. Strong Technical Environment** (SVN used? Test Automation?)
- 8. Sunny Day Visibility** (Does everyone on the team understand the rate of progress being made on the product?)
- 9. Regular Cadence or Rhythm** (Is heartbeat of the system on?)

Recap

-

 11. Communication Model
 12. Communication Technologies & Effectiveness
 13. Collocated vs Distributed Team
 14. Skills to Manage Stakeholders
 15. Define Positive Values

Communication Management Plan

Tools & Techniques / Communication

- Identify who need to involved in communication
- Identify what information they need, when and at what frequency
- Identify how they want to be communicated
- Understand why a particular information is required by a stakeholder, at a particular frequency, in a particular format
- Understand the impact of not giving a particular information in desired format or frequency to a particular stakeholder

Important Note

- Expand efforts in communicating only when providing information helps your project or not providing may cause some issue
- Use appropriate technology for each communication need
- **Cost of communication** is cost of communication technology, cost of time in making, sending, receiving, analyzing, responding queries etc.
- Optimize your report format, frequency and communication cost by knowing number of communication channels. Channels= $N \times (N-1)/2$
- Document the path of escalation for effective communication

Team Space

Tools & Techniques / Communication

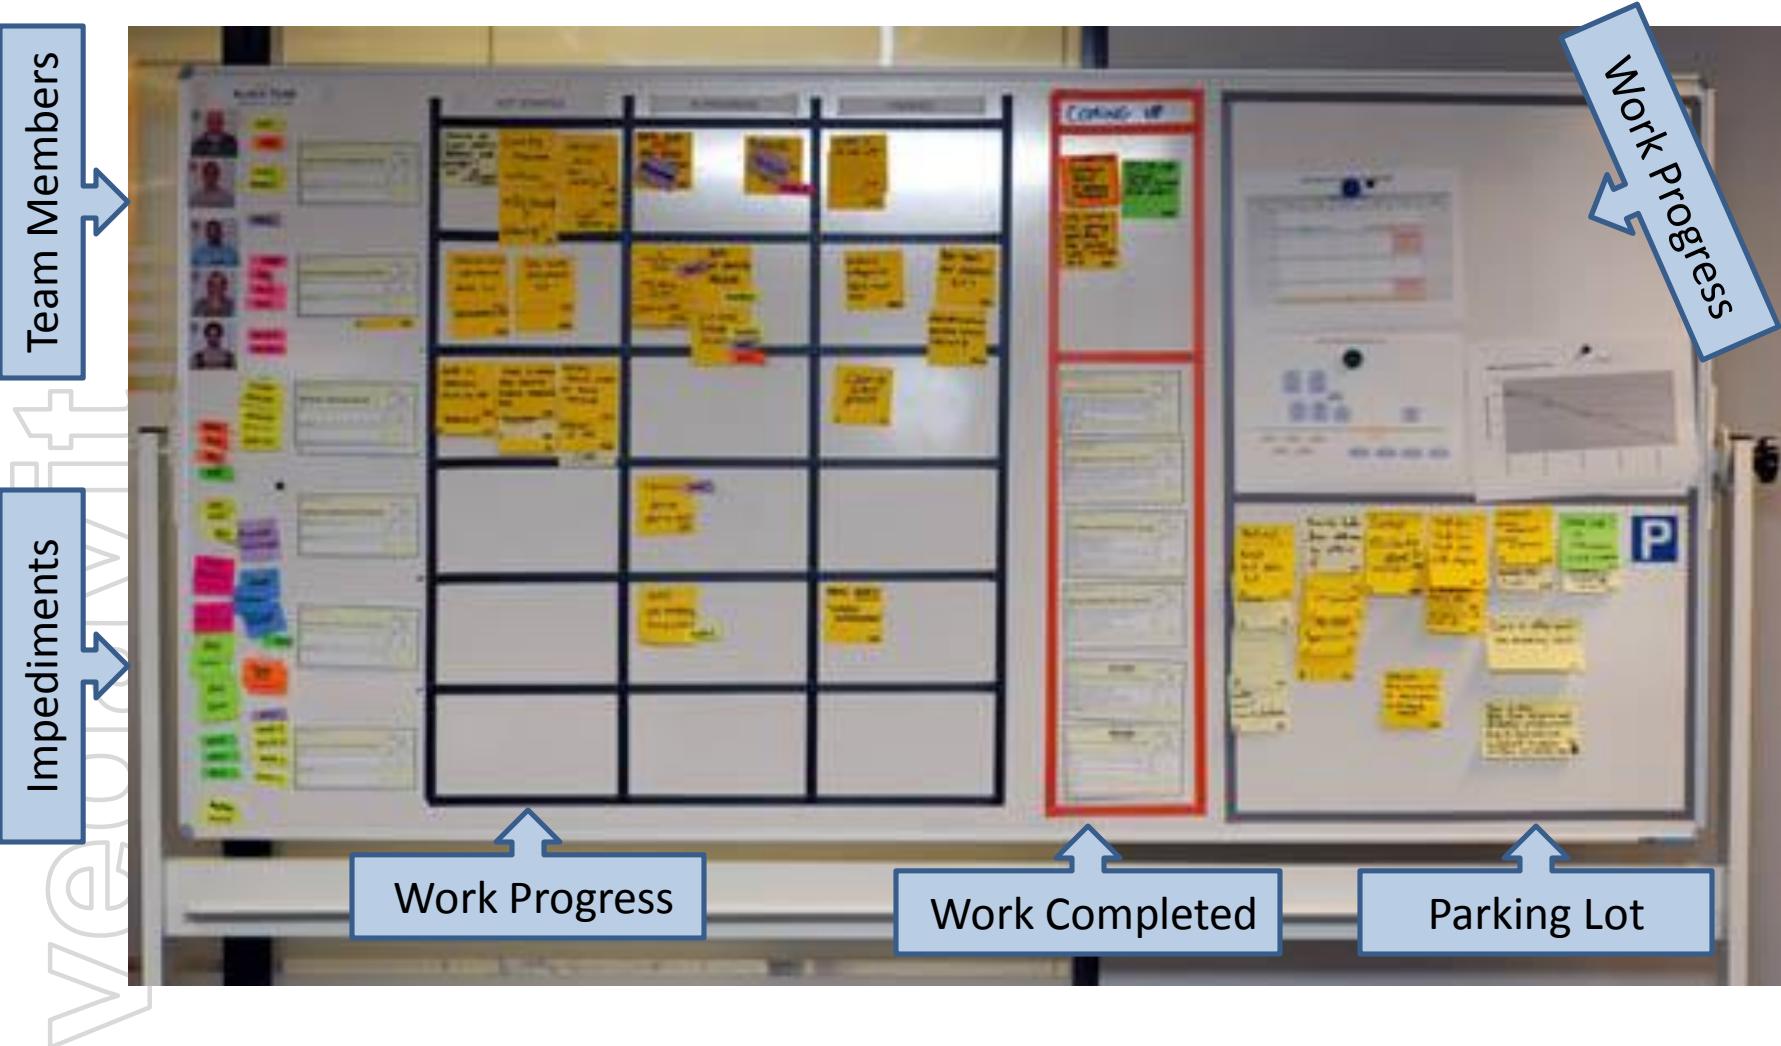

Team space is working area of agile project team. Only those people who are contributing to project directly should be allowed to sit, stay and talk in that area

- This area should be
- **Informative**
 - **Spacious**
 - **Comfortable to work**
 - **Shielded from external noise**
 - **Easy to collaborate**

Having expert in the same room where rest of the team is sitting is called “Expert in earshot”

Information Radiator

Osmotic Communication

- Agile project relies on collocation, minimum documentation, least reporting, maximum constructive engagement. This can be achieved if frequently sought important information is available in published form in team space
- Whoever need the information can go and get the information without wasting time in requesting, making, sending, receiving the information
- Benefits
 - Least cost, effort and time waste in communication
 - Updated information is always available without making new reports
 - People can get whatever particular information they are looking for
 - Happens at the same time
 - Feedback loop is quick
 - Those people who are left in regular reporting also get benefitted
 - No junk, old, repetitive information, but fresh and useful.
- Dis-benefits
 - Some people get extra information which they do not need
 - It is left to individual's interpretation

Daily Stand-ups

- Daily stand-up is heart beat of agile project management
- Team meets daily (typically in working area, war room) at fixed time (time should not be changed) preferable first thing in morning
- This is not reporting session but information sharing among team members
- Only “Pigs” allowed to speak, “chicken” should listen (they are not allowed to interfere or ask while stand up meeting is in progress)
- It is 15-20 min meeting, conducted while everybody is standing (showing the sense of urgency). A person should not take more than 2 min to update this work status.
- Any one in the team can facilitate this meeting
- Project manager notes the impediments and start working on those immediately after the meeting is over.

Daily Stand-ups

Tools & Techniques / Communication

3 Questions of standup meeting which every team member must address are

1. What did they do yesterday?
2. What are they planning to do today?
3. Any impediments on the way today?

V

b

Dimensions of Communications

- Internal vs External
- Formal vs Informal
- Vertical vs Horizontal
- Official vs Unofficial
- Written vs Oral
- Verbal vs Non-verbal

Level of Listening

- Level 1: Internal Listening (interpret in own language)
- Level 2: Focused Listening (Responding without interpreting in own language)
- Level 3: Focused but understand global environment (team, organization, customer etc)

Vedavit

Communication Skills

- Active Listening
- Probing Ideas for Better Understanding
- Fact Finding
- Expectation Management
- Conflict Resolution
- Next Step Identification
- Making Commitment
- Contribute Effectively

Communication Barriers

- Physical Distance => Physical Proximity
- Working in Different Shifts => Temporal Proximity
- Human Language
- Technical Knowledge
- Detrimental Attitude
- Difference in Culture
- Difference in Project Environment
- Attitude, willingness => Amicability
- Communication Channels

Communication Methods

 - Influencing
- Managerial Skills
 - Presentation
 - Public Speaking
 - Writing
 - Negotiation

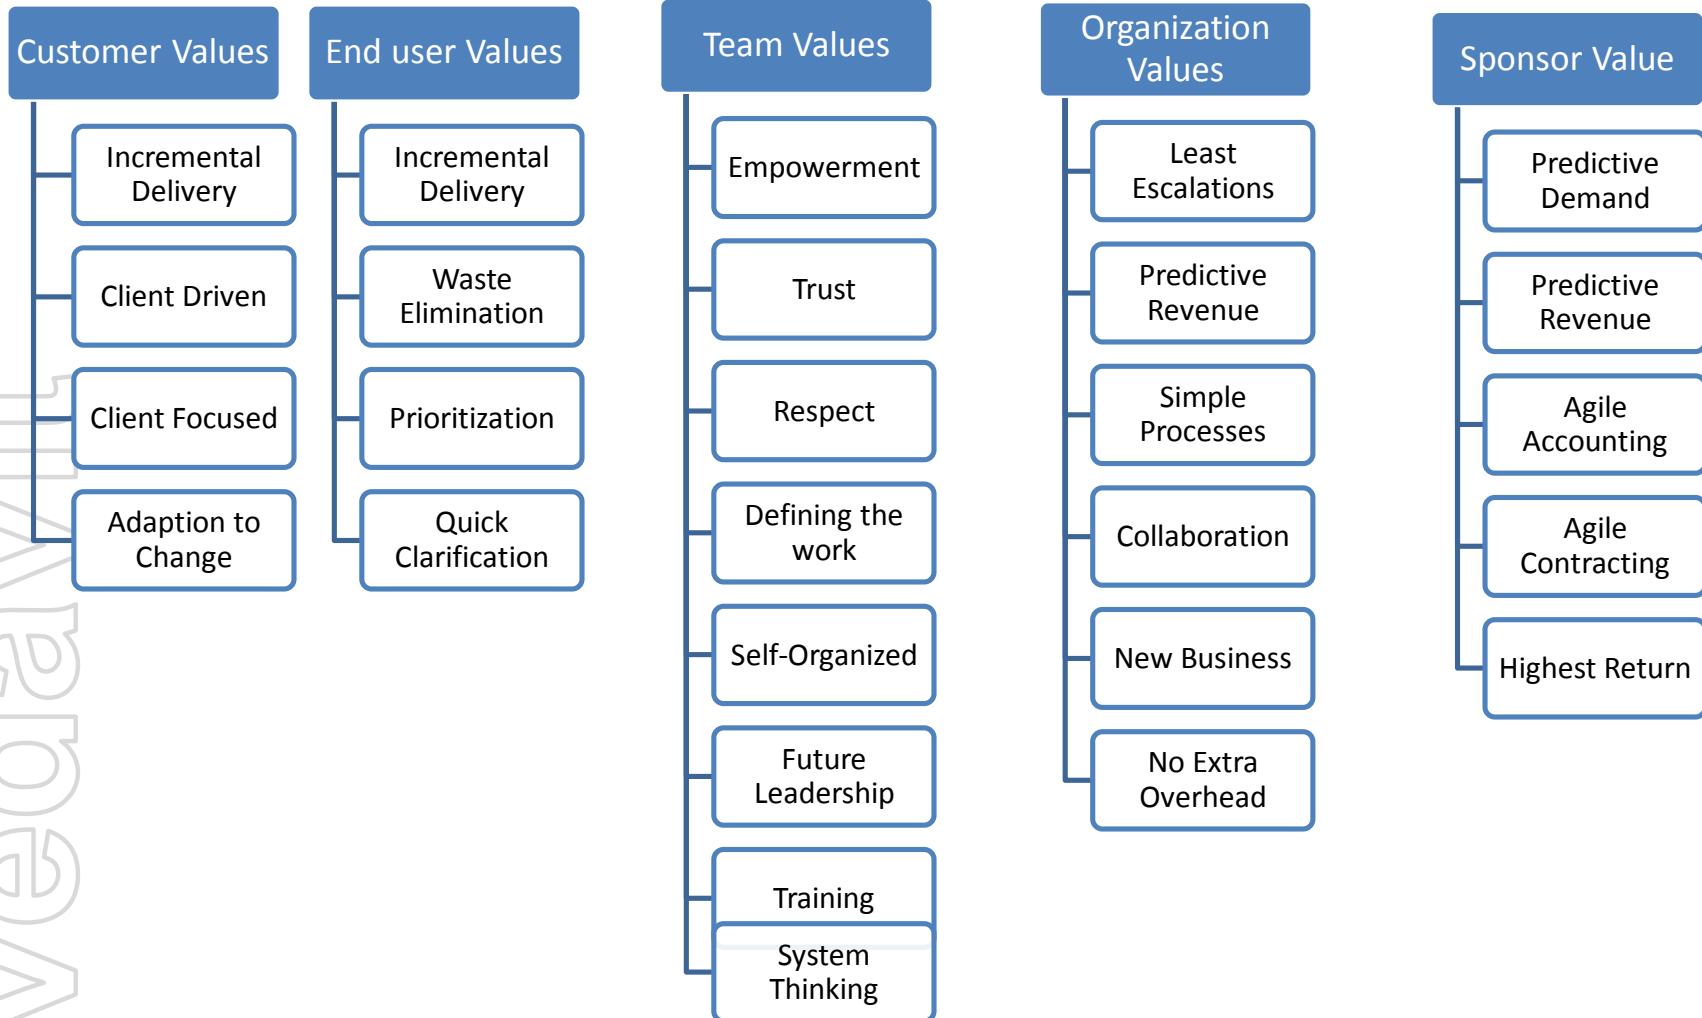

vedavit

Define Positive Values

- For effective communication we must understand values of various stakeholders. This is one of the major shift of management from Traditional to Agile Project Management
- Understand and define values of
 - Customer
 - End user
 - Team
 - Organization
 - Sponsor

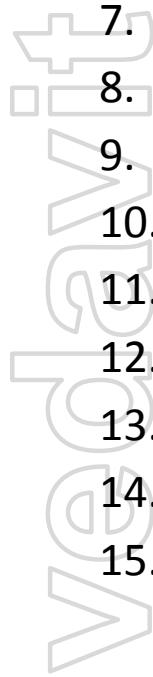

Define Positive Values

vedavit

 11. Process Tailoring
 12. Agile Contracting Methods
 13. Agile Project Tracking
 14. Innovation Game

Progressive Elaboration

Tools & Techniques / Planning, Monitoring & Adapting

- Requirements in a project may not be known fully at the start of project. Because
 - Future requirements depends upon the results of earlier stages
 - It will be decided based on the reaction of market
 - Business conditions are too volatile so nothing can be predicted right now
- **Progressive elaboration** relies on planning and executing only that work which is clearly known, has high priority and must be done in current period. Planning for remaining work can be done in future as and when detail requirements are known

Vedavit

Adaptive Planning

- Adaptive planning is about incorporating lessons learned. Adjusting your future pace, processes, resources etc based on previous cycle of delivery.
- Adaptive planning is required because what we want to develop may not be completely known or other factors like processes, tools, technologies, skills availability, business environment, market condition etc are not fully known or reliable and they all affect your planning.
- It is complete opposite of predictive planning where everything is known at the time of planning.
 - In modern time it is extremely difficult to know about all the factors, which are affecting project success, in advance
 - Adaptive planning and empirical processes are the truth of 21st century! Days of definitive processes and predictive planning are not many.

User Story

Tools & Techniques / Planning, Monitoring & Adapting

- A user story concept is kernel of Agile Project Management
- A user story is work which a user want system to accomplish because it meets some of his objectives.
- A user story is not functional specification document. It is a promise of product owner to the team that he will explain the requirements in details when the team is working on this
- User story template
 - “As a user I want to accomplish something so that business value”

“There have been great societies that did not use the wheel, but there have been no societies that did not tell stories.” Unknown

Types of User Stories

- Business user story
 - “As a class teacher I want to mark attendance of student so that we can issue them certificate”
- Bug user story
 - “An error message is displayed whenever I try to save file in pdf format”
- Technical user / Technical Spikes story
 - “Research a search component in .NET3.5 which is fit for our application”
- Non-functional user story
 - “The Student Affairs Information System is up and running 99.9% during the registration time period defined in the Academic Calendar.”
- Documentation user story
 - “Develop a user manual for teachers to use teacher module”

3Cs of User Story

Tools & Techniques / Planning, Monitoring & Adapting

- Card
- Conversation
- Confirmation

vedavit

INVEST Model of User Story

Tools & Techniques / Planning, Monitoring & Adapting

INVEST model defines following characteristics of a user story

- Independent
- Negotiable
- Verifiable
- Estimatable
- Sized Appropriately
- Testable

vedavit

Epic, Feature, Story, Task

Tools & Techniques / Planning, Monitoring & Adapting

- Epic is a collection of features. An epic is typically 1-3 months in duration
- Feature is collection of stories. A feature is typically 2-4 weeks in duration
- User-story is smallest unit of requirement created from features. A user-story is typically less than a week in duration
- Task are smallest unit of executable items which team members assign to themselves to complete a user story. A task is typically of 8 hours in duration

Agile Planning

Tools & Techniques / Planning, Monitoring & Adapting

- Agile project management does not rely on big bang planning rather it believes in level of planning.
- Three level of planning in agile are
 - Release Planning
 - Iteration Planning
 - Daily Planning

Vedavit

Agile Planning

Tools & Techniques / Planning, Monitoring & Adapting

Release Planning

- Creating a release plan is responsibility of product owner
- If some user story cannot be estimated due to technical complexity then technical spikes are created
- Typical length of a release varies between 3-6 months. For every month of work you can spend max one day for release planning. Thus 3 month release you can spend max 3 days.
- Release planning should not be done without knowing velocity
- It takes 3-4 uninterrupted iterations to benchmark velocity for a project team
- Release planning depends upon
 - Deadline from competitor
 - Supporting the contract
 - To meet predetermined schedule
 - Supporting financial deadline
 - When there is enough value
 - To test the product
- Two types of release plan
 - Scope-boxed release plan
 - Time-boxed release plan

Agile Planning

Tools & Techniques / Planning, Monitoring & Adapting

Release Planning

Product owner is ready with prioritized product backlog (prioritization is done based on business value)

Product owner defined release goals

During release planning product owner picks up only those user stories and features which helps him achieving release goals

All the selected user stories are pushed into release backlog

User stories in release backlog are size estimated using agile estimation techniques like story points

User stories in release backlog are again prioritized. It helps in creating number of iterations and iteration plan.

Agile Planning

Tools & Techniques / Planning, Monitoring & Adapting

Iteration/Sprint Planning

- In iteration planning team identifies the task to be performed for each user story.
- Tasks are pushed into iteration backlog
- Iteration planning is held after retrospective meetings of last iteration
- Typical iteration length varies from 1-4 weeks.
- Iteration planning duration (1 hour for every week of iteration)
- Iteration planning identifies iteration backlog items, assumptions, risks, actions, dependencies
- Some teams start counting iteration from zero so the initial iteration is called **Sprint 0** or Iteration 0. In this iteration they take all technical spikes which will help them in estimating size of complex user stories. Preparing initial architecture, solving infrastructure setup and configuration issues. Following Sprint 0 they start release planning
- Tasks in iteration backlog are not assigned to any team member. Agile teams are self-organized and they pickup the task on their base.
- Number of hours available in any iteration are calculated as Ideal engineering hours.

Agile Planning

Tools & Techniques / Planning, Monitoring & Adapting

Iteration Planning

Product owner defines Iteration Goal

User stories to be completed in an iteration is prioritized and selected by product owner. Agile team helps him in prioritizing technically related user stories.

Team picks selected user story and identifies task to be done in order to complete selected user story. All the identified tasks are pushed into Iteration Backlog. Mostly these will be programmer-centric tasks. Consider definition of "done".

Effort estimate of each task is completed by team member using their experience

During planning team stop pushing tasks into iteration backlog when number of hours available for the iteration are exhausted

Agile Planning

Tools & Techniques / Planning, Monitoring & Adapting

Daily Planning

- Immediately after or before daily standup meeting sessions and the team updates the kanban board.
- This reflects the progress and planning of the day based on
 - The work progress of previous day
 - Any internal or external dependency not met
 - Something critical comes up
 - Client want to drop some user story

vedavit

Time-boxing

- Iteration length is time-boxed.
- Following sequence of activities takes place in any time-boxed iteration
 - Grooming product backlog (done by product owner, in parallel to iteration work)
 - Iteration Planning (1 hour for every week of iteration)
 - Daily stand-up (15 min, max 2 min for one person, typical team size of agile team is 7 ± 2)
 - Regular iteration work
 - Iteration Review (1 hour for every week of iteration)
 - Iteration Retrospective (1 hours for every week of iteration)

Minimum Marketable Features (MMF)

Tools & Techniques / Planning, Monitoring & Adapting

- MMF is basic minimum set feature of the product so that people can start using it
- MMF can be made of a single or combined of multiple user stories
- MMF has business value to the end user

vedavit

Process Tailoring

- Tailoring is the process in which Agile Project Team customizes organization level defined process for their agile project.
- One of the major input for process tailoring is output of retrospective meetings
- Tailoring is done based on the understanding of project environment including customer need, skills etc.
- Some example of Process Tailoring
 - Define the “Definition of doneness”
 - Define the format of Retrospective meetings
 - Define Kanban board
 - Define columns of Product Backlog
 - Define some report format
 - Define Iteration Duration
 - Define process of automatic testing

Process Tailoring

Tools & Techniques / Planning, Monitoring & Adapting

Tailoring Mistake

- **Unfamiliarity:** Early adaptor implements whatever works for them temporarily not what is right and then fail down the line
- **Top-down Thinking :** Agile is successful when it is adopted from bottom. So it should be bottom-up
- **Culture change:** Undermining cultural changes
- **Incomplete implementation:** Thinking that it is waste of time same activity every time so not giving due importance to practices
- **Silver Bullet Syndrome:** To deliver a successful project you need good tools, experienced people, high team spirit, SMEs etc. Process is just one but important aspects of all these.

Agile Contracting Methods

Tools & Techniques / Planning, Monitoring & Adapting

- Time & Material Contract
 - Most suitable contract type for agile project
 - Execution is driven by customer and they decide when a team member is required
 - Mutual trust is required in terms of skills provided to do the work and money will be provided for resource whether work is given by customer or not.
- Fixed Price (FP) Contract
 - Most unsuitable for agile project which expects you to understand the full scope of work before you bid for the project
 - During execution customer need to help in prioritization while vendor may end up wasting efforts for nothing
 - FP can work in agile projects only
 - If customer should pay for every sprint
 - If provision to convert FP into T&M at any point of time is there
 - Provision to terminate by any party at any point of time is there

Agile Contracting Methods

Tools & Techniques / Planning, Monitoring & Adapting

- Time & Material with Cap Contract
 - Customer can mention maximum number of people required in project and he can ask for those people at any point of time
 - Vendor need to ensure those resources are available on demand and have updated knowledge and skills to perform the work
- Fixed Price (FP) Per Story Point
 - From vendor's point of view this is better than fixed price
 - A method to calculate story point need to determined and agreed in advance because story point rate is agreed earlier than story point calculation
- Fixed Price per Release
 - With respect to customer and vendor both this is better than FP and FP Per Story Point
 - Number of iteration in release should be defined upfront
 - Duration of each iteration need to defined earlier

Agile Project Tracking

Tools & Techniques / Planning, Monitoring & Adapting/ Agile Project Tracking

1. Information Radiators
2. Self-assessment
3. Kanban Board
4. Cumulative Flow Diagram (CFD)
5. WIP Limit
6. Burn Charts
7. Retrospectives

Kanban Board

- After iteration planning is complete and before agile team starts working on task of the iteration, agile team need to pull the task from sprint backlog and put on kanban board
- Kanban board has several columns. You can customize these columns based on your project characteristics. Typical columns are “User Story”, “To be done”, “Doing”, “Done”, “Accepted”
 - You keep moving tasks from of any user story from left to right based on the progress. Finally when all the work is done all the cards will move under “Done” and user story will move user “Accepted” column

Kanban Board

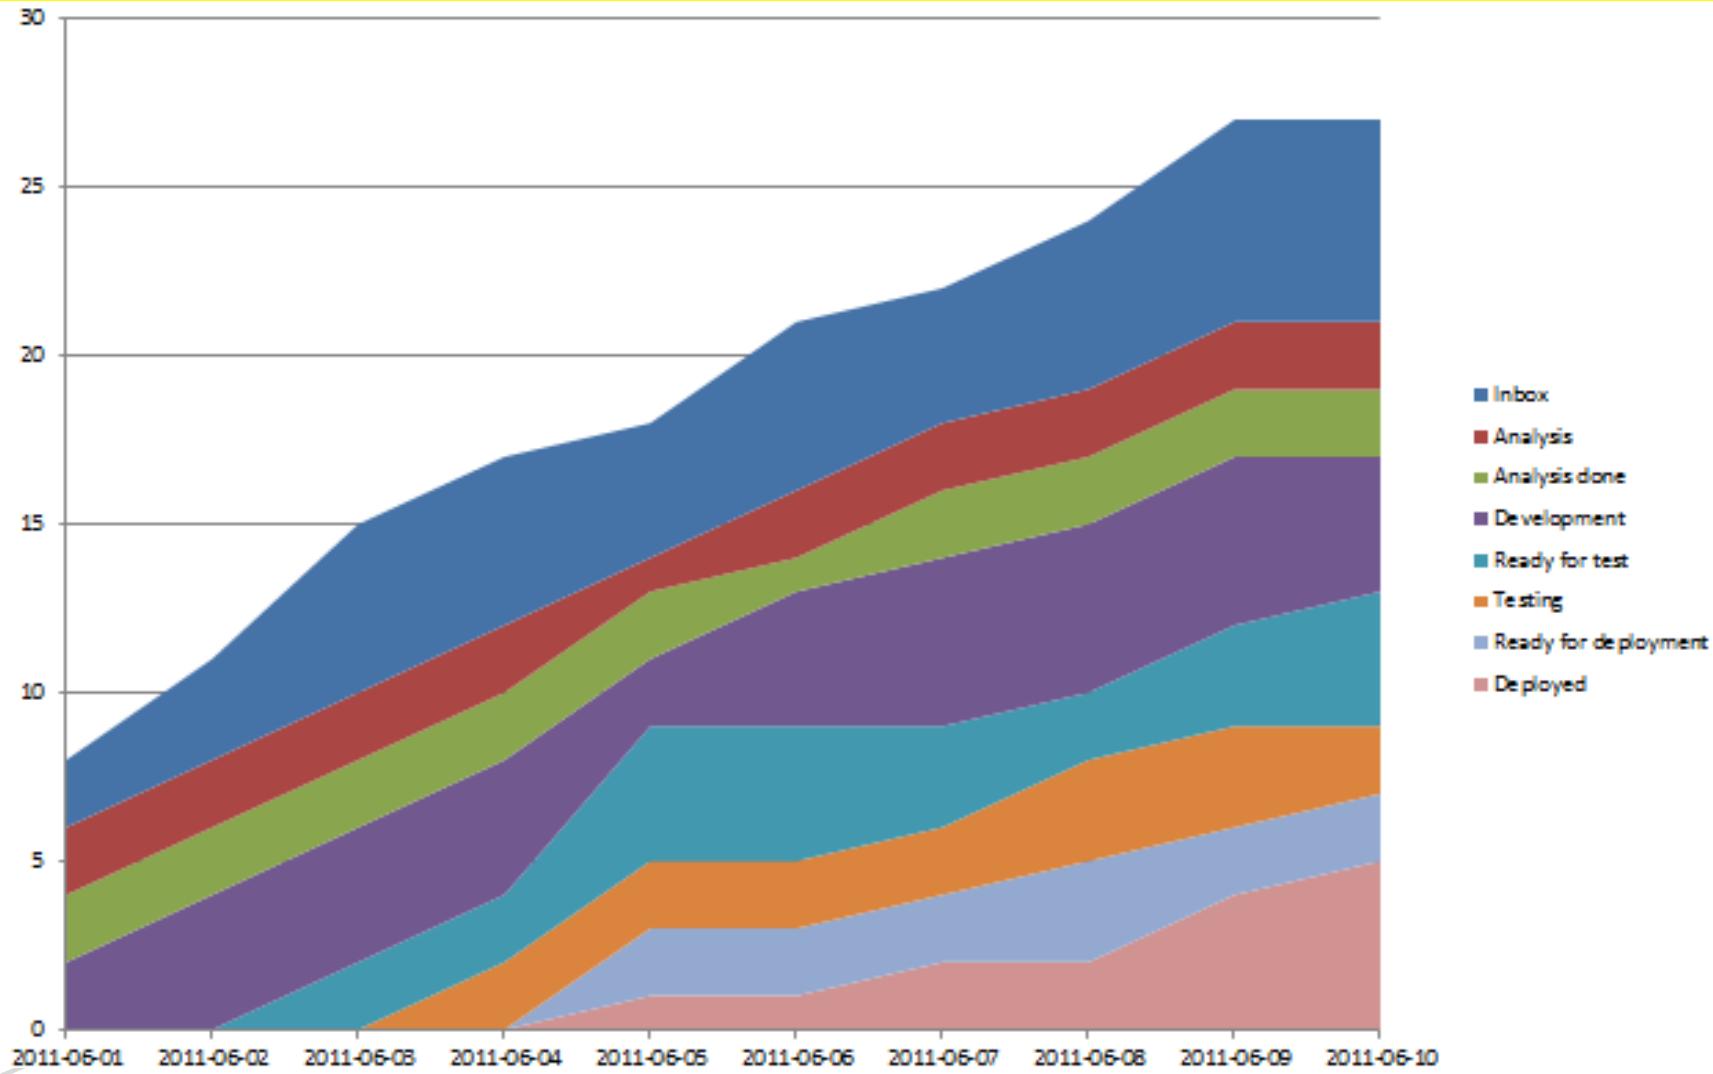

Tools & Techniques / Planning, Monitoring & Adapting/ Agile Project Tracking

Story Kanban Board

Task Kanban Board

Cumulative Flow Diagram (CFD)

Tools & Techniques / Planning, Monitoring & Adapting/ Agile Project Tracking

WIP Limit

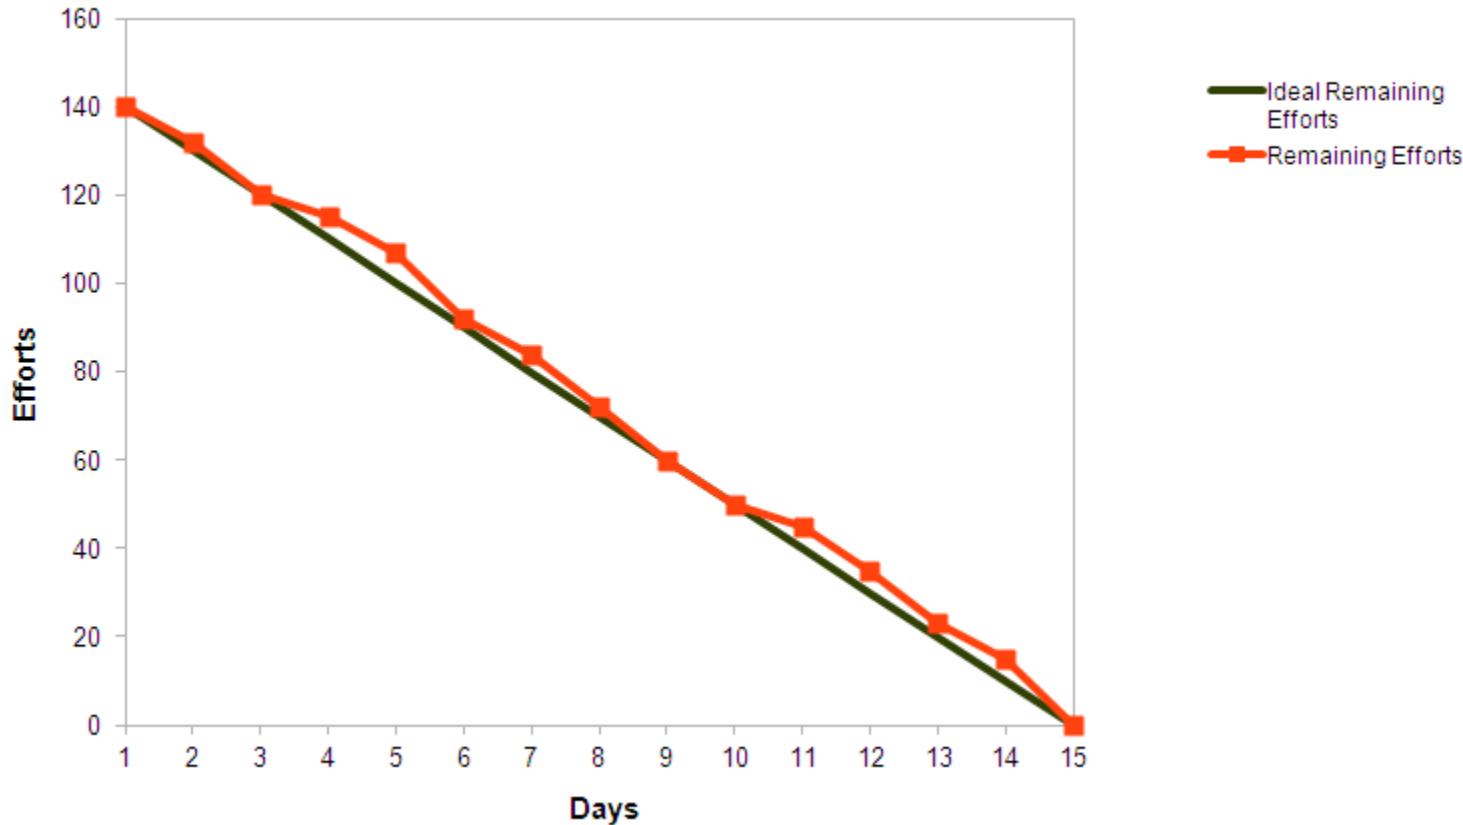

- WIP limit is maximum number of work in progress items
- In Kanban concept agile team should ensure that during execution at no point of time items in “in-progress” column should cross a defined WIP limit
- “In-progress” work is treated as of no-value thus it is treated as waste. Therefore to maximize the value focus should be to convert WIP items into completed
- Just-in-time (JIT) concept should be utilized to keep WIP limit smallest possible
- Low WIP limit is also a challenge as it creates wastage of machine and workforce time

vedavit

Retrospectives

Tools & Techniques / Planning, Monitoring & Adapting/ Agile Project Tracking

- Retrospective is conducted by agile team at the end of each sprint and each release
- Retrospective sessions are self-reflection sessions, to understand how we are doing and how can we improve it further. Kaizen is at the heart of every retrospective session.
- Retrospective leads to adaptive planning
 - Depending upon the need, confidence of team, time of retrospective, nature of team members structure of retrospective can be adopted

Retrospectives

Tools & Techniques / Planning, Monitoring & Adapting/ Agile Project Tracking

Structure of retrospective

- Set the stage (set ground rule/ working agreement)
- Gather Data (Share relevant data)
- Generate Insights (ask why it happened and how it happened)
- Decide what to do (Action plan)
- Close Retrospective (Appreciate participation)

vedavit

Retrospectives

Tools & Techniques / Planning, Monitoring & Adapting/ Agile Project Tracking

Methods to generate insights

1. Brainstorming

Retrospectives

Tools & Techniques / Planning, Monitoring & Adapting/ Agile Project Tracking

Types of Retrospectives

- **Pillars Of Agile Spiderweb Retrospective** : A retrospective in which team rates its abilities in each of the categories, displayed the different ratings on a spider graph, and then discussed the result. To talk about what abilities are important to an Agile team and how agile team rates against them. **Dur: 60**
- **Appreciative Retrospective** : Uses Appreciative Inquiry to identify what went so well. There is no blame or negativity, and builds on the Prime Directive, that everyone in the team did the best job they could possibly do. It reminds everyone that what good job they are doing rather than focusing on negatives every time you run a retrospective. **Dur: 60**
- **Top 5** : Participants choose top 5 issues and bring them along for group to discuss and resolve. Expose the most pressing issues in an initially anonymous manner and determine the most effective actions to resolve them. **Dur: 45**

Retrospectives

Tools & Techniques / Planning, Monitoring & Adapting/ Agile Project Tracking

Types of Retrospectives

- **Plan of Action** : A Retrospective Technique for short term actions from long term goals. Really good for forcing achievable actions from a retrospective. **Dur: 40**
- **Start, Stop, Continue** : The facilitator captures team open-ended feedback using a wheel that encourages team members to assess an iteration or milestone. What should be start new, what should we stop, what should be continue from last iterations. **Dur: 10 to 25**
- **6 Thinking Hats Retrospective** : Uses De Bono's 6 Thinking Hats to investigate process improvement. General use, but also a good alternative to shuffling card type retrospectives. **Dur: 60**

Retrospectives

Types of Retrospectives

- **Each One Meets All :** The method ensures that each participant meets and interacts with every other participant. This retrospective makes sense when retrospective participants do not know each other well. **Dur : Variable!**
- **The Complexity Retrospective :** Use various tools such as a complexity radar to discover and find out how to deal with the complexity in your project. Many projects go awry due to excessive complexity; use this plan to evaluate whether your team is approaching things in the simplest way that can work; especially when the deadlines begin to loom. **Dur : 40-60**
- **Force Field Analysis :** A plan designed around the force field analysis technique. A retrospective for your whole company/department or to analyse a particular topic. **Dur : 60**

Retrospectives

Tools & Techniques / Planning, Monitoring & Adapting/ Agile Project Tracking

Types of Retrospectives

- **Pomodoro Retrospective** : Focused and time-constrained by using the Pomodoro technique. Useful for determining a single action to improve the work of a small team. **Dur : 25**
- **Retrospective Surgery** : A retrospective for retrospectives. To learn how to improve the effectiveness of your retrospectives. **Dur : 60+**
- **Questions Retrospective** : Iteration retrospective. To get different perspectives on the same events. **Dur : 60**

Retrospectives

Types of Retrospectives

- **Four L's Retrospective** : Liked – Learned – Lacked – Longed For. Iteration and project retrospectives as well as for retrospection of training and conference events.. **Dur : 90 - 120**
- **Sailboat** : What anchors slow the team down, what wind propels it forward?. Good for the "gather data" and "generate insights" portions of a retrospective. **Dur : 90 - 120**
- **Weekly Retrospective Simple + delta** : Review, Plus-Delta, Vote, Actions, Owners. A weekly retrospective for your project. **Dur : 60**
- **Jeopardy Retrospective** : Use the answers as base to get all the good things and bad things that happened. A different way to "gather data" and to get all different opinions on a subject. **Dur : 60**

Retrospectives

Tools & Techniques / Planning, Monitoring & Adapting/ Agile Project Tracking

Temperature Reading

This retrospective can be conducted, to know the feeling, sentiments of the team. This is conducted by a facilitator and it follows following structure. Adequate time should be give to each part.

- Specific Appreciation
- New Information
- Puzzles
- Complaints with Recommendations
- Goals, Hopes and Wishes

Vedavit

Retrospectives

Tools & Techniques / Planning, Monitoring & Adapting/ Agile Project Tracking

ROTI (Return on Time Invested)

- Feedback and Adaptation are part of Agile Project Management. Feedback starts with meeting and specifically retrospective meetings.
- ROTI (Return on Time Investment) is a quick and easy method to gauge the time spent on meetings or workshops, and to improve their effectiveness.
- Take 5-15 minutes at the end of the meeting to ask participants to rate their return on time invested, using the **Fist of Five technique**
- If most of number you are getting is 1 or 2 then it means something is serious and you are wasting time and something different need to be done
- ROTI is quick, easy, sometimes funny, and works very well, even with top management.

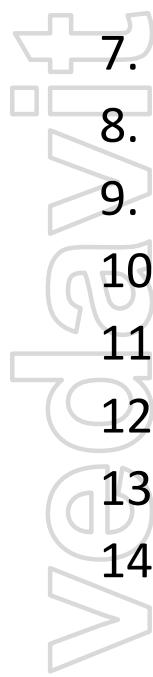

Innovation Game

Tools & Techniques / Planning, Monitoring & Adapting

- Product development is innovative game therefore everybody need to contribute and play is role in the game with the spirit of game. It's a game of cooperation and collaboration.
- Things becomes boring in game when
 - You are doing same thing again and again without innovating some other method of doing work
 - People do not take action and they talk a lot
 - Only few people are participating and others are not getting involved
- Therefore
 - Innovate the newness in the game
 - Innovate the new way of engagement
 - Do what you say
- Must read book on Innovation Game: A book by Alistair Cockburn : Agile Software Development : The Cooperative Game

Size Estimation Techniques

Tools & Techniques / Agile Estimating & Metrics/ Size Estimation Techniques

1. Relative Sizing
2. Story Points
3. Wideband Delphi
4. Planning Poker
5. Affinity Estimation

Relative Sizing

- We know at the start of project not enough detail is available to estimate the size of work. But high level requirements are available in the form of epic or module
 - Best way to estimate in this situation is relative sizing method
 - Based on current understanding of system and modules team picks up smallest size epic and then start comparing that with other modules.
- Down the line at the time of release planning features or user stories are identified in epic and finer estimation is possible but again at this level preferred method of estimation is Relative Sizing
- Hours, duration, cost based quantitative estimation makes sense only when you know the task to be done. But even for user story level estimation in release planning neither you have time nor it is worth to identify task to do quantitative estimation

V
e
d
a
v
i
t

Story Points

- User story is the functionality of the system which has value in the eyes of customer
- Count of user stories is called story points this is used to size user stories.
- Because all stories are not same in efforts, complexity and risk therefore different methods are used to normalize this factor
- Size is function of relative efforts, complexity and risk not of duration or IEH etc. Therefore when estimating size take away duration, number of people etc from your mind.
- Some story point estimation methods are
 - T-shirt size – Story Point Estimation
 - Fibonacci Series – Story Point Estimation
 - Fruit size – Story Point Estimation

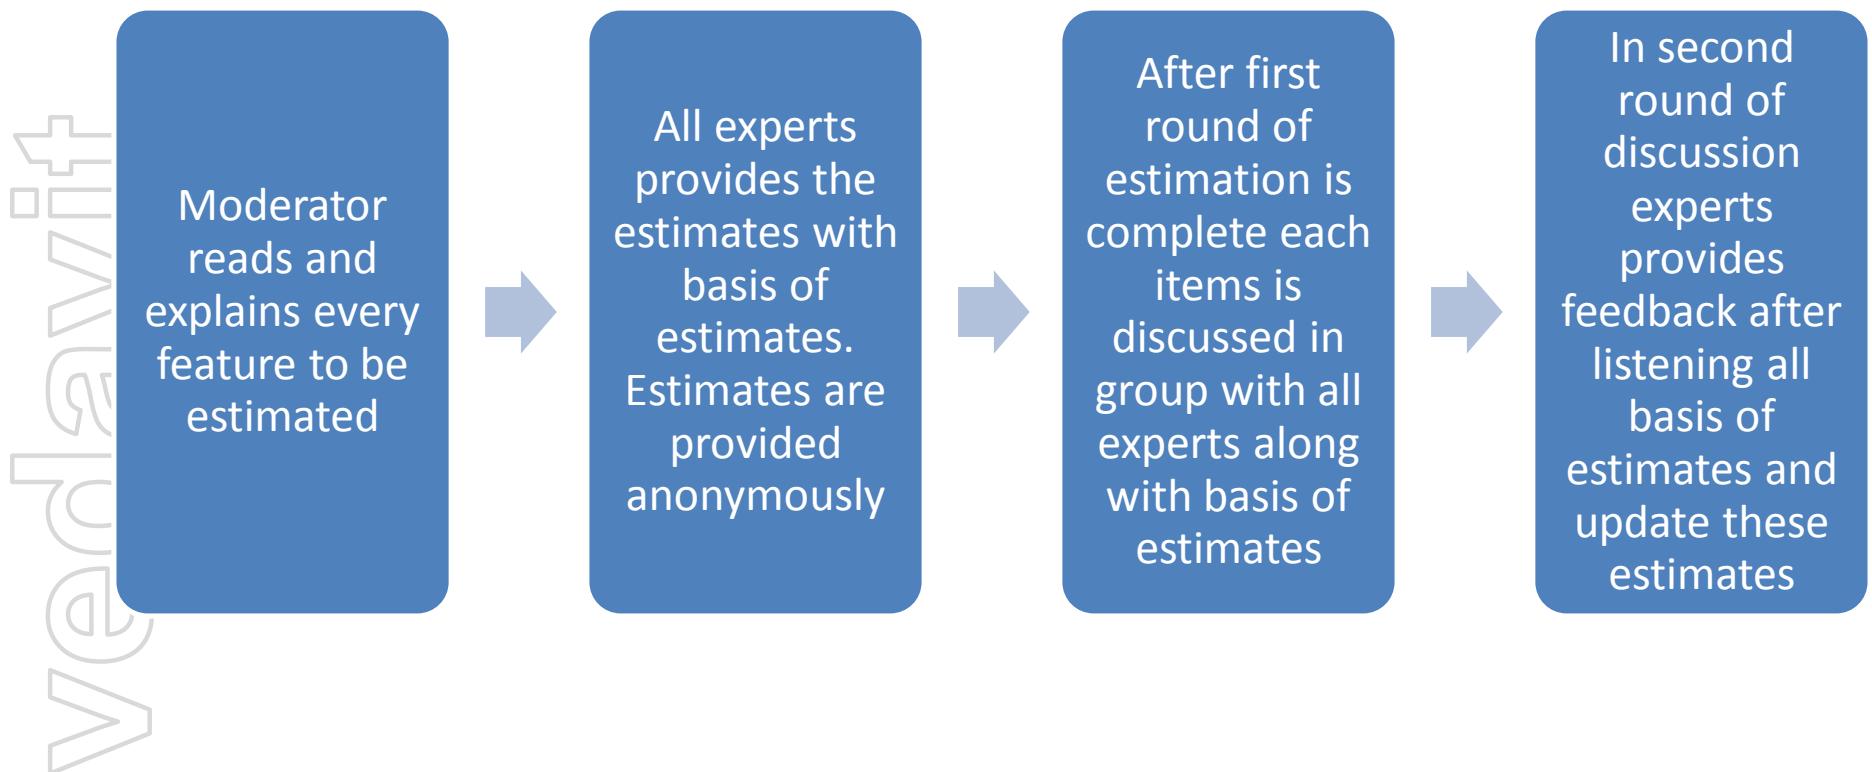

Story Points

- Let us say our **product back log** has
 - 8 x bananas (5 points each) = 40 story points
 - 10 x pineapple (20 points each) = 200 story points
 - 6 x oranges (8 points each) = 48 story points
 - 30 x bunches of grapes (2 points each) = 60 story points
- **Total story points** in product backlog is $40+200+48+60 = 348$
- Let us assume that based on guess or some previous release teams knows that their velocity is 30 story points
- Total iterations required = $348 / 30 = \mathbf{11\ iterations}$
- If iteration is of 2 weeks then **22 weeks** required to finish the work in product backlog

Wideband Delphi

Tools & Techniques / Agile Estimating & Metrics/ Size Estimation Techniques

- Wideband Delphi is consensus based estimation method. A moderator facilitates the session.
- Delphi technique keep names anonymous and helps avoiding biases and politics

Planning Poker

Tools & Techniques / Agile Estimating & Metrics/ Size Estimation Techniques

- Planning poker is widely used estimation technique in agile projects. This is a variation of Wideband Delphi.
- Logistic Required for Planning Poker Estimation
 - As many set of deck cards as many estimators in the room
 - All the team members with a deck of cards inside the room
 - A coordinator with laptop
 - A facilitator
 - Product owner

Planner Poker Process

1. Facilitator projects the product backlog on wall using a projector
2. He reads loudly a user story at a time so that everybody in the room understand what they need to estimate
3. Estimator estimates it silently and shows the card only to the coordinator
4. Coordinator documents all the estimates provided by all estimator
5. If there is difference between estimates then estimators who provided two extreme estimates need to talk the basis of estimates.
6. After a short discussion. Next round of estimation starts the same way as before and coordinator document the estimate provided by estimator
7. Keep repeating steps 3,4,5,6 till estimates provided by estimators are not converged
8. Read next user story

Affinity Estimation

- If product backlog has more than 20 items then implementing planning poker method of estimation is too much time consuming. In that case affinity estimation technique is most suitable
- This helps in providing coarse estimates and good enough for release planning but for iteration planning you should use Planning Poker.
- Logistics for Affinity Estimation
 - A set of cards with printed user story. A story on a card.
 - A wide magnetic board with magnetic balls
 - All the team members inside the room
 - A coordinator with laptop
 - A facilitator
 - Product owner

Affinity Estimation

Tools & Techniques / Agile Estimating & Metrics/ Size Estimation Techniques

Facilitator writes “smallest” at extreme left end of magnetic board and “largest” at extreme right of magnetic board

Set the ground rule of estimation session. Like it is mute session so we should not talk at all. All cards which are put on table need to be arranged on wall from left to right in terms of their relative size. You can shift position of cards from left to right or vice versa put by other member but without talking, convincing anybody, arguing or any kind of body language.

Estimators starts reading card and arranging them on the wall. If required they can discuss in private with product owner

If they are not able to understand any card ever after discussion with product owner they can move the card into Questionable column

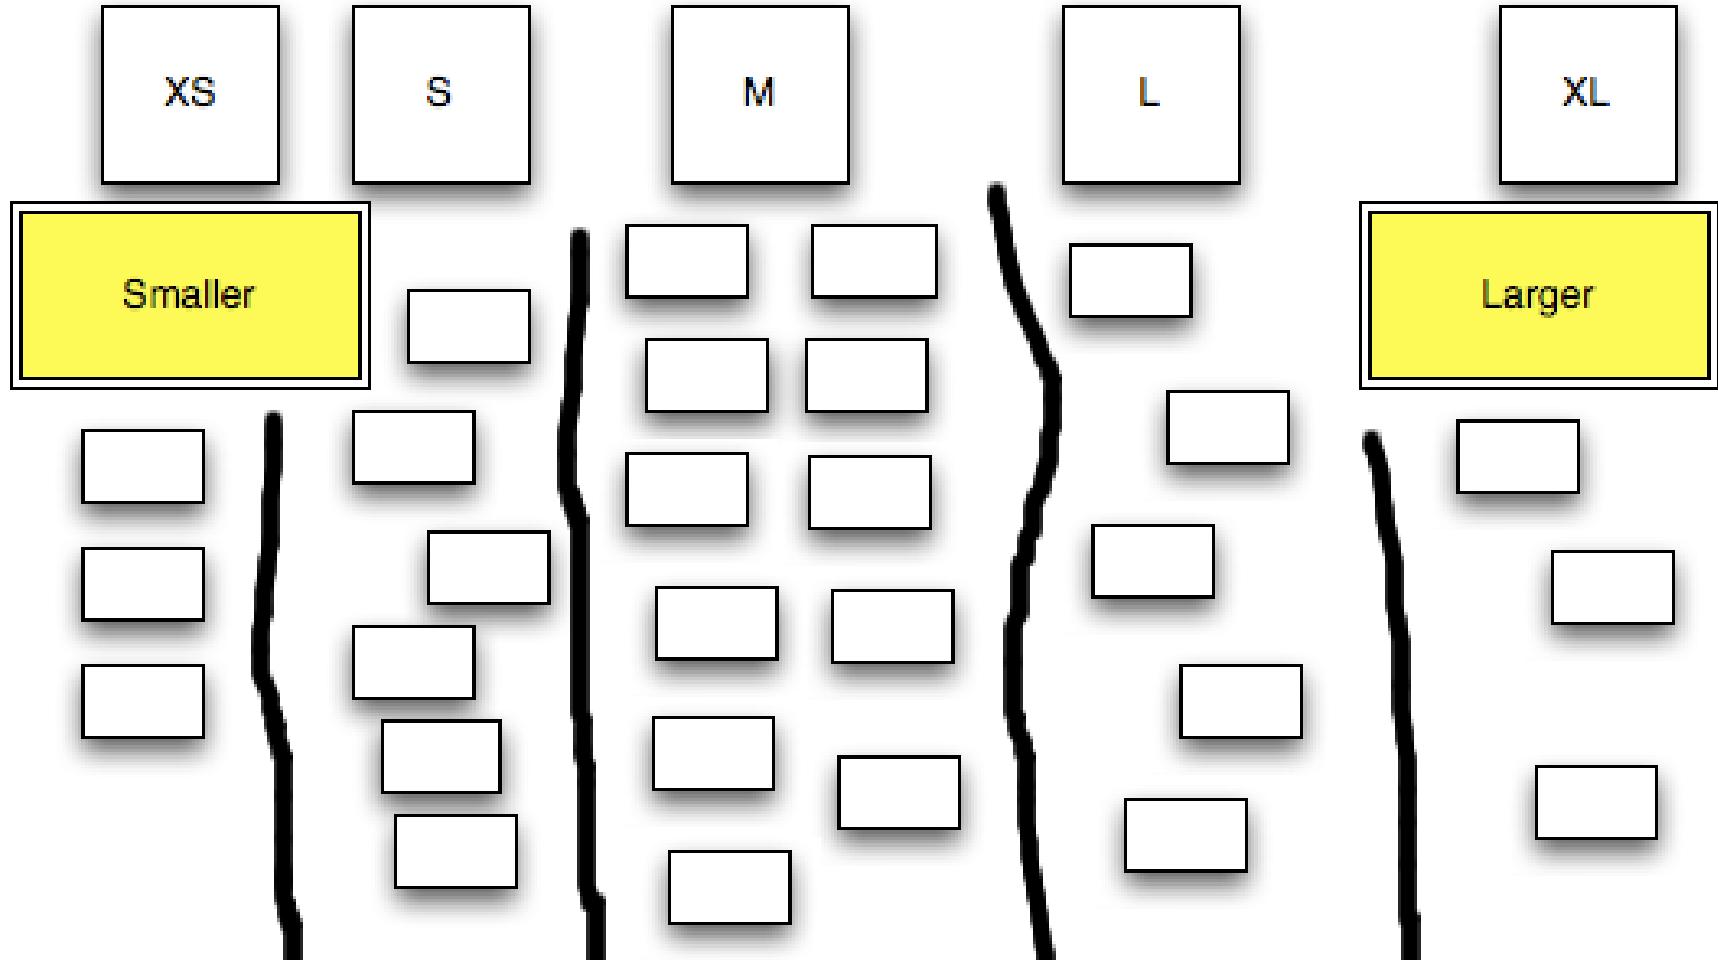

After the session is over they need to group these cards in 5 or more groups like smallest, minor, medium, larger, largest

Coordinator need to type all these estimates into computer and share with project manager

Affinity Estimation

Metrics

Tools & Techniques / Agile Estimating & Metrics/ Metrics

1. Velocity
2. Lead Time
3. Cycle Time
4. Ideal Time
5. Escaped Defects
6. Project Scheduled
7. Features & Value Delivered
8. Delivery Performance
9. Product and Technical Quality Assessment

Velocity

- Velocity is number of story a team can do in an iteration.
- When you are starting a new project that point of time best way to know the productivity is guess based on previous experience. But never benchmark velocity of team based on previous project
- It takes 3-4 iteration to stabilize velocity of team
- Team members should not be added or removed from development team otherwise it destabilized the velocity
- **Methods to improve velocity**

- Periodically pay down technical debt
- Improve customer involvement
- Support energized work environment
- Provided needed resources (people, equipment, software etc)
- Offload admin duties of programmer
- Add experienced programmers

Lead Time (LT)

- Lead time is the time required to deliver a given amount of work.
 - eg. Lead time to make tea is 15 min. From the time order is placed till the time tea is on table.

vedavit

Cycle Time (CT) & Throughput

- **Cycle Time** is actually a measure of **Throughput**
- **Cycle Time = 1/ Throughput**
- **Throughput** is measured as **units /period of time**
- **Cycle Time** is measured as **amount of time/unit.**

Example : At a tea stall for preparing a tea

- Cycle Time = 2 minutes/ cup of tea
- Throughput = 30 cups / hours

Relationship Between CT, LT and WIP

- Lead Time = Cycle Time * WIP or
Lead Time = WIP/Throughput

Metrics

- Kanban does not have concept of iteration and thus it does not talk about bunch of user stories in that iteration.
- Kanban deal with individual user stories (it may be bug user story) and tracks the time to complete that user story. Thus the concept of Cycle Time and Throughput and WIP is important here.

Ideal Time

Case Study:

Suppose a project where 5 team members are working starts on 1-Jan (Monday) and Finishes on 31-Jan. Company working times are from 8.00 am to 12.00pm and 12.00pm to 17.00pm. Company working days are Mon to Fri. In this period, there are two state holidays falling on organization working days.

- How much is elapsed time of this project?
- How much is duration of this project?
- How much is effort required (actual effort) to complete the project?
- How much is Ideal time in the project?
- How many Ideal Engineering Hours (IEH) in the project?

Metrics

Ideal Time

- How much is elapsed time of this project?
 - 31 Days
- How much is duration of this project?
 - 31-8 (4 week ends) – 2 (holidays)= 21 Days = 168 Hours
- How much is effort required (planned effort) to complete the project?
 - 21 days X 5 people X 8 hours =840 Hours
- How much is Ideal time in the project?
 - Ideal time excludes the time of meetings, emails, peer review, phone calls, training, being pulled off to another work, task switching, tea breaks, lunch breaks, smoke break, biological break etc.
 - Excluding lunch and tea breaks a company typically has 8 working hours will not have more than 80% ideal time. That is ideal time on any day is 6.4 hours (max)
 - Thus ideal time for above project is 21 days X 6.4 hours = 135 hours
- Ideal Engineering Hours (IEH)
 - If all 5 people on project are working individually (i.e. no peer review etc) then IEH = Ideal time * No of People = 675 hours

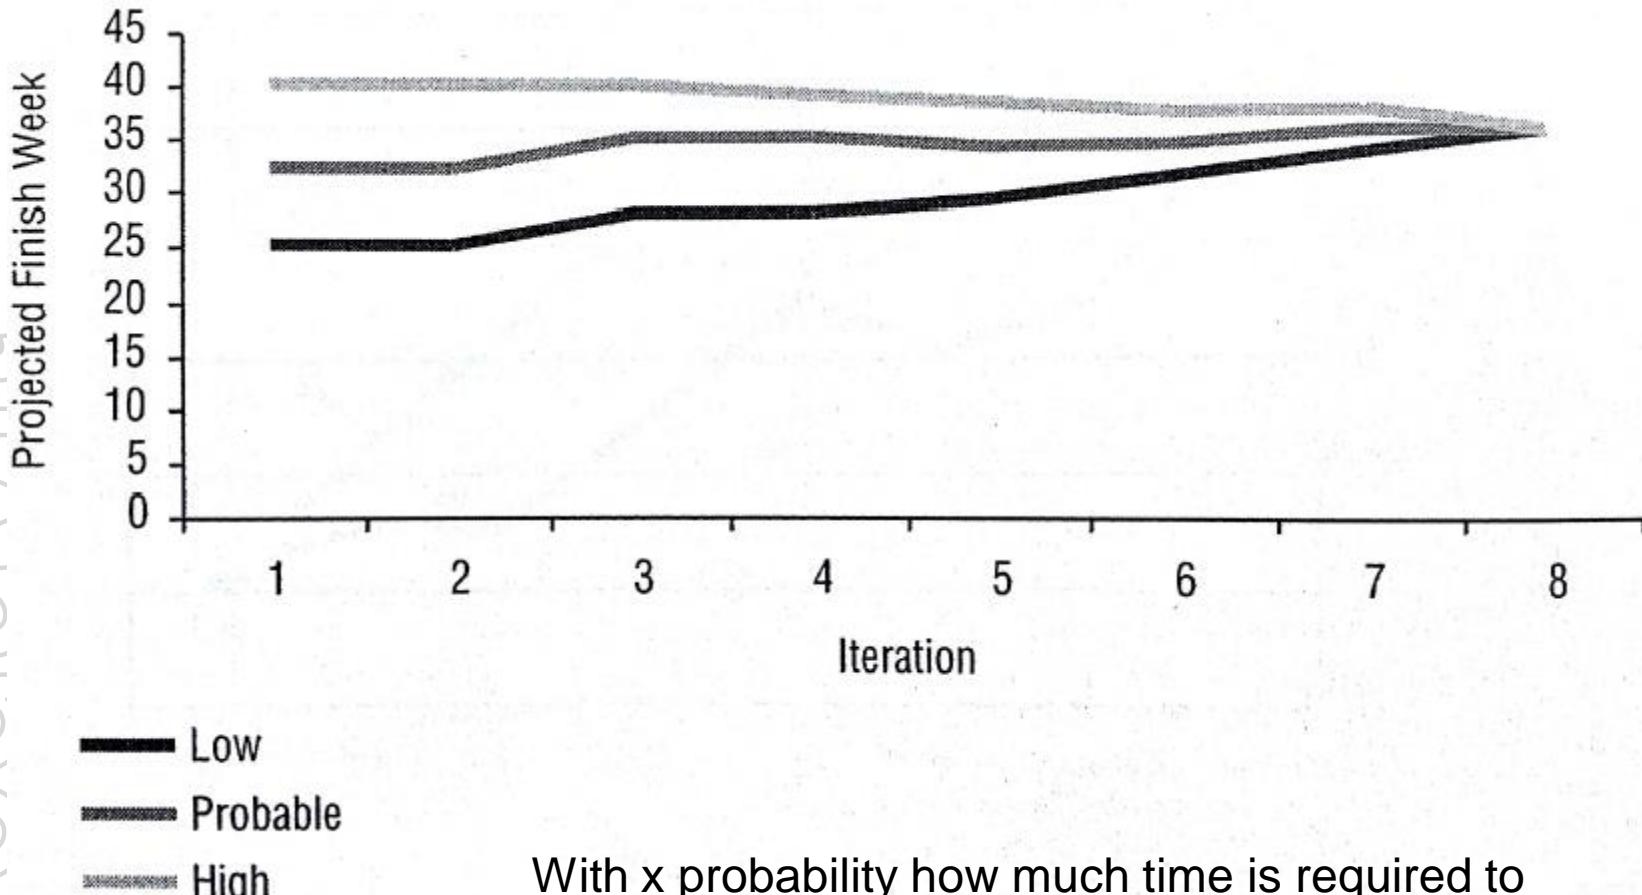

Escaped Defects

- In Agile escaped defects mean those defects which are leaked to next iteration or sprint.
- **Escaped Defect Rate** = Total number of weighted defects for a sprint / number of total stories delivered in that sprint
 - Tracking the trend of this metrics helps you understanding the quality of product and maturity of testing process

vedavit

Metrics

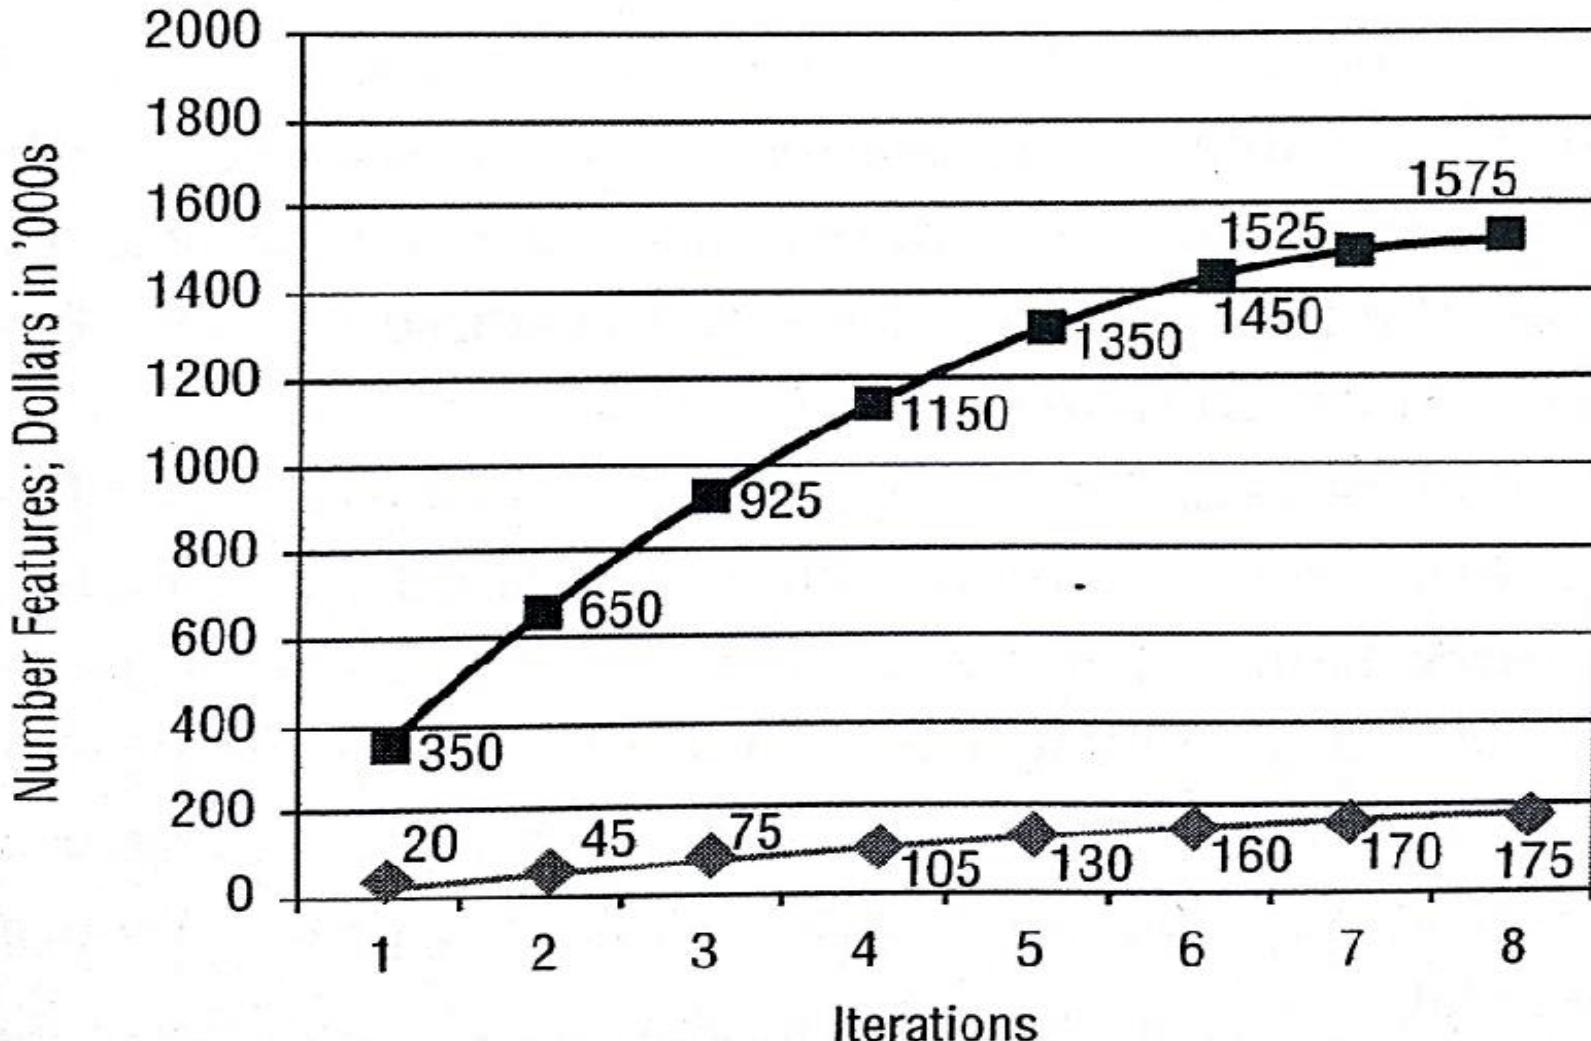

Projected Scheduled

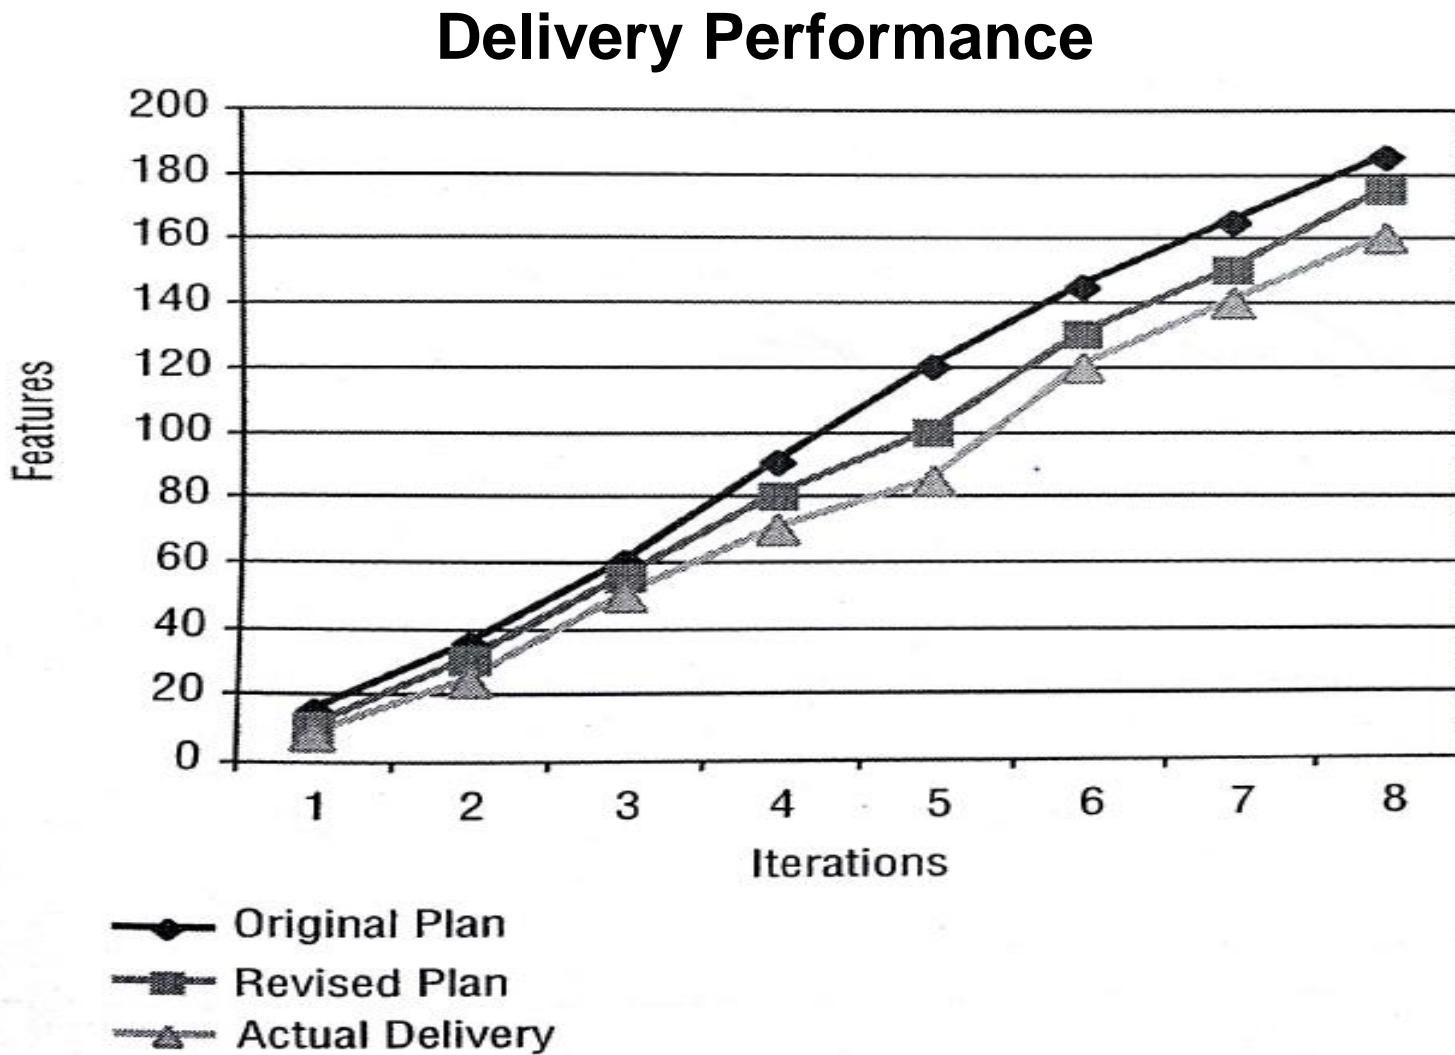

With x probability how much time is required to complete the project. Track this information for every iteration

Metrics

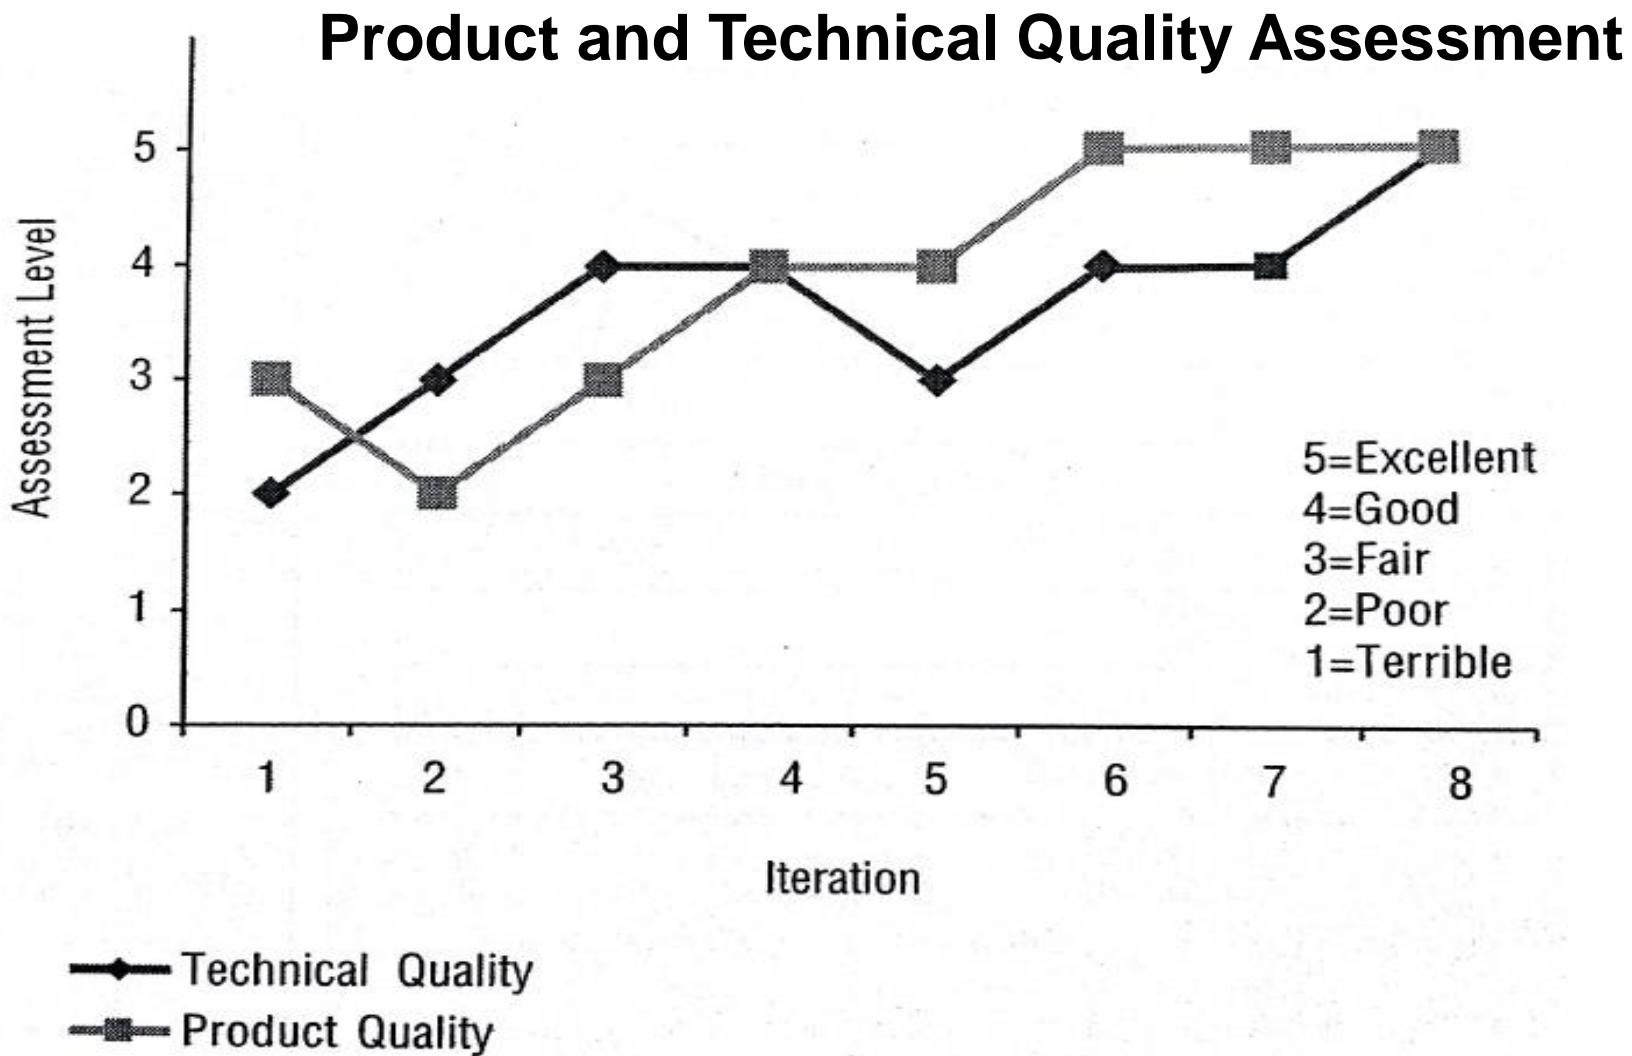

Features & Value Delivered

Metrics

Metrics

Cost Estimate

- Cost estimate for any release or iteration implies cost of all the resources used delivering user stories of the release or iteration.
- Cost of resource includes cost of service used from vendor, cost of human resources, cost of software/hardware used, cost of training, cost of expenses like travelling, communication etc.
- Opportunity cost is economic cost.

vedavit

Cost Estimate

- Methods of estimations
 - Analogous Estimating
 - Parametric Estimating
 - Bottom-up Estimating
 - Vendor-bid Analysis
 - Reserve Analysis
 - Cost of Quality
- Type of cost estimates (range names)
 - Order of magnitude (-25% to +75%)
 - Budgetary (-10% to +25%)
 - Definitive (-5% to +10%)

Basis of Estimation

- Estimates are never absolute. There are certain assumptions related to productivity, dependency, complexity, resource availability, resource rates etc which dictates the efforts, cost, duration and quality of the product of project
- Basis of estimation helps you determining the range

Earn Value Management

- Earned value in Agile can be calculated using story point, efforts, cost. Being a time-boxed methodology time does not change
- Lets us assume that product owner has planned one product
 - Release with three iteration and each iteration is of 2 weeks.
 - IEH in first, second and third iteration is 60, 60, 80 (adding resources) respectably (total 200 IEH).
 - Story points of user stories to be completed in this release is 30 SP.

Note: Although this approach is detrimental to agile because agile project management does not allow product owner to decide IEH to complete the stories he selected to complete in the release. But lets us assume that after some iterations of working team has stabilized the velocity and this velocity factor helps them determining IEH required to complete the release. Based on the velocity team feels confident to complete 30SP in 200 IEH. Lets assume iteration is complete and we are calculating EVM

*IEH is Ideal Engineering Hours

Earn Value Management

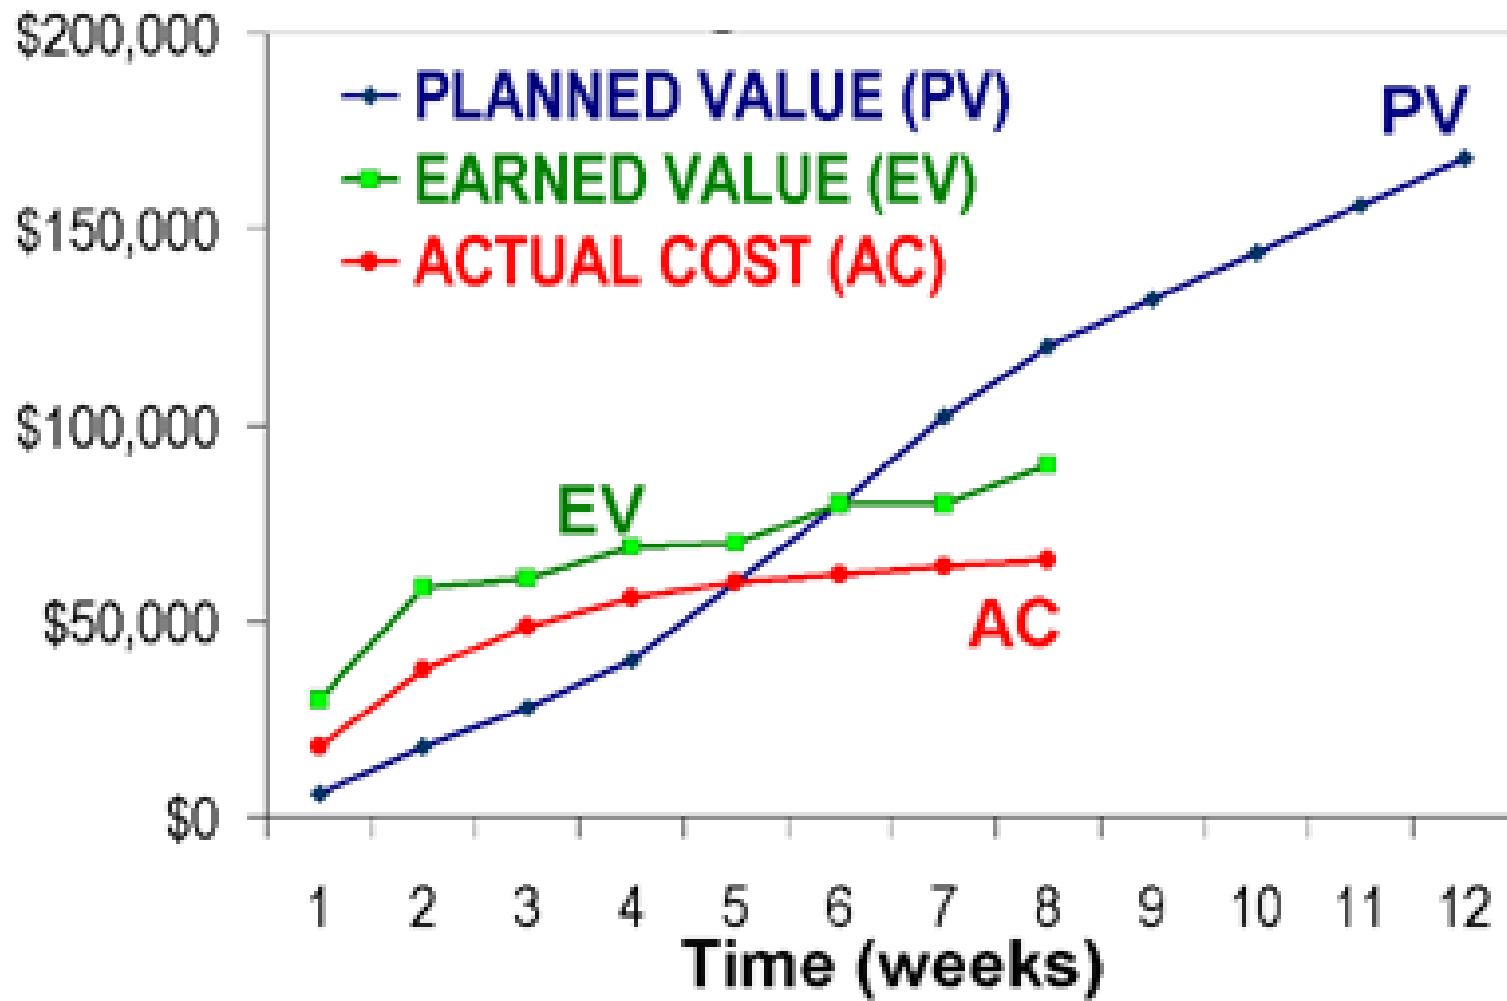

- Case 1 –Story Point based EVM
 - BAC- Total Story Points in current release = 30
 - PV- Planned story points to be completed at the end of 1st Iteration = 8
 - AC- Completed story point =7
 - ETC- More story to be completed in future iterations = 24
 - **EV = BAC – ETC =6**
- Case2- Efforts based EVM
 - BAC- Planned efforts for current release = 200 IEH
 - PV- Planned efforts for the of 1st iteration = 60 IEH
 - AC- Actual efforts at the end of 1st iteration = 60 IEH (Agile does not encourage over time)
 - ETC- Efforts required to complete remaining story points = 120 IEH
 - EV- Budgeted efforts for the completed user stories = BAC – ETC = 80 IEH
- If you know the cost of resources you can calculate EVM based on cost also

Earn Value Management

Tools & Techniques / Agile Estimating & Metrics

- $CV = EV - AC$
- $CPI = EV / AC$
- $SV = EV - PV$
- $SPI = EV / PV$
- $EV = BAC - ETC$
- $EAC = AC + ETC$
- $EAC = BAC / ETC$
- $EAC = BAC / (SPI * CPI)$
- $VAC = BAC - EAC$
- $TCPI = (BAC - EV) / (EAC - AC)$

Release Backlog

ID	Description	Sprint #	1	2	3	4	5	6
			Effort needed for Release 1 as in the beginning of the sprint	90	70	34	0	0
1	Set up continuous integration system		5	0	0	0	0	0
2	Create compilable application skeleton		5	0	0	0	0	0
3	Display current temperature in a simplest possible way		13	0	0	0	0	0
4	Set up the web server for serving weather data		3	0	0	0	0	0
5	Implement stubby WeatherML support on the server side		13	0	0	0	0	0
Sprint 1	Make sample data go from server to device							
6	Graphics support on the client side		20	0	0	0	0	0
16	Make the graphics library draw some icon and sample temperature text		-	13	0	0	0	0
17	Draw the real weather screen		-	8	0	0	0	0
7	Implement support for several days		8	8	0	0	0	0
8	Implement support for rain, snow, etc. icons		2	2	0	0	0	0
9	City changing support		-	5	0	0	0	0
Sprint 2	Minimal working version							
10	Fetch one day temperature data from the weather provider system		+ ?					
11	Fetch rain, snow, etc details from the provider							
12	Fetch several days data from the provider							
13	Auto-refresh feature							
Sprint 3	Plug in the real weather data							
Release 1	Sellable version							
14	Inject simulated ads from the test server							
15	Plug real ads in							
18	Change current city automatically according to the cell info							
Sprint 4	Advertisements support							
Release 2	Ad-supported version							
	Effort in the whole backlog	170	150	114	80	80	80	
	Backlog state taken after the end of sprint 3 = after release 1							

Effort left until Release 1

Effort left in the backlog

Release backlog is created during release planning meetings. PO is responsible for this

Backlog

Sprint Backlog

- Unlike product backlog and release backlog which is comprised by user stories, sprint backlog is comprised of task
- Sprint Backlog can have following types of tasks
 - Design Tasks
 - Coding Tasks
 - Testing Task
 - Documentation Tasks
- No one is allowed to add user story or task in Sprint backlog but team can delete task if they feel out of time
- Sprint backlog is developed at the time of sprint planning

Backlog

Sprint Backlog

- Generally every task in sprint backlog should be related to some user story
- To identify task for user story programmers need to do the detail discussion about user story with PO
- Each task in sprint back log should have following information in the form of Task card
 - Task description
 - Estimated hours
 - Owner name (if taken by any team member)
 - Exit criteria
 - Verification method (test or inspection)
 - Who will perform verification

Backlog

Sprint Backlog

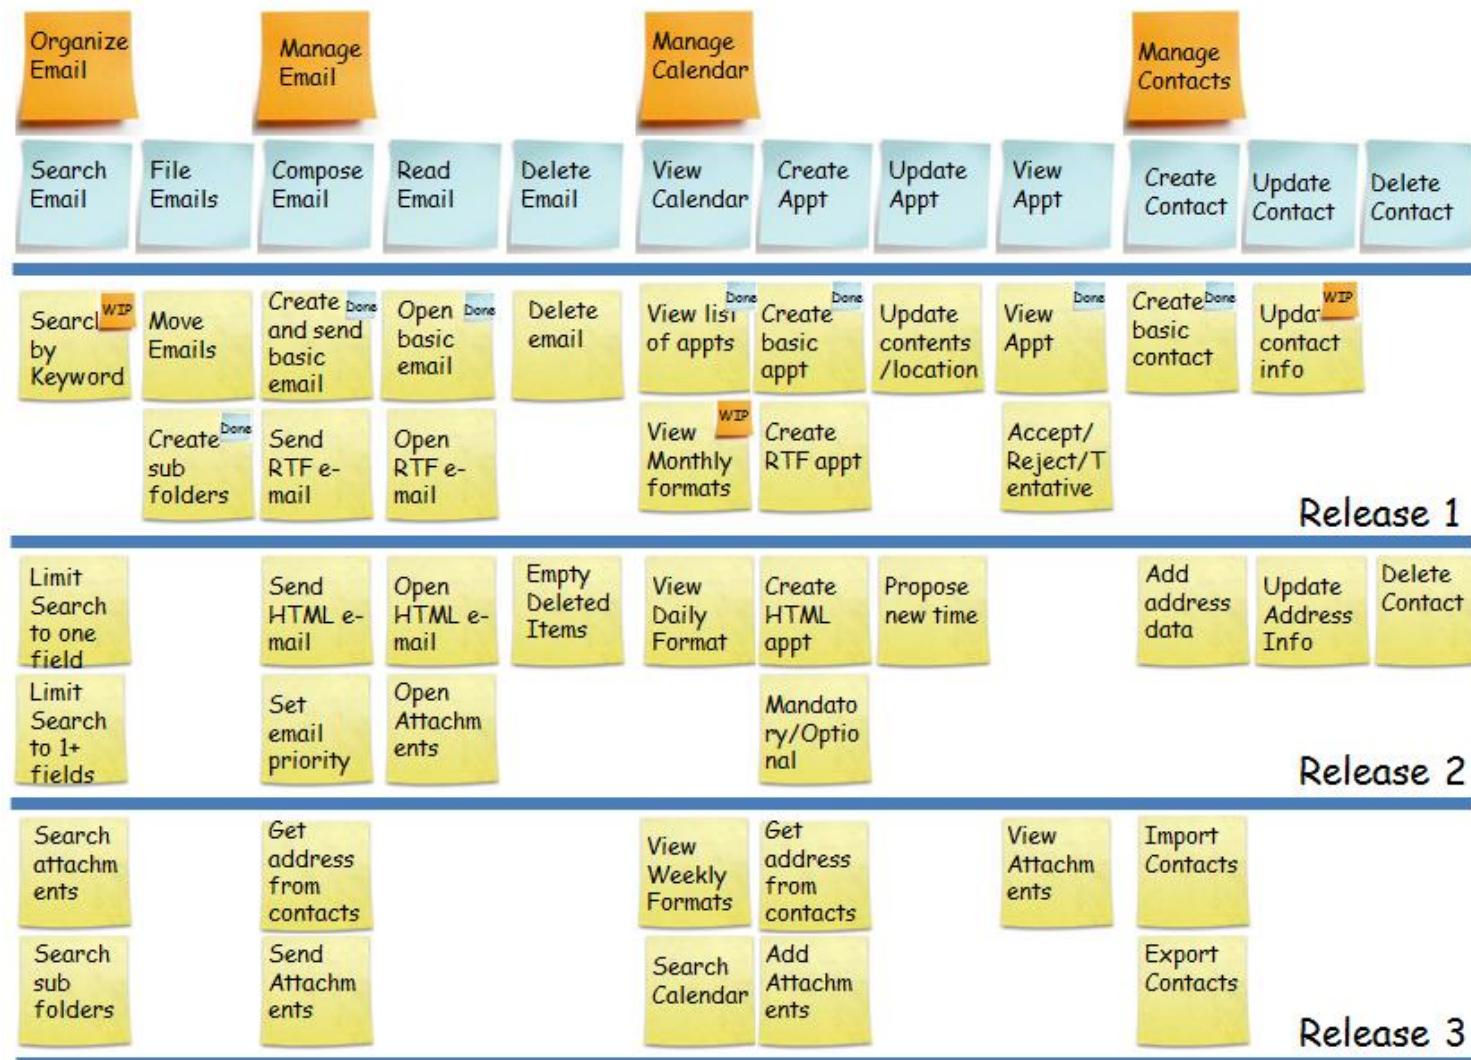

Story	To Do	In Process	To Verify	Done

As a user, I... 5 points	Code the... 8 Code the... 4	Code the... DC 8 Code the... 6		Test the... SC Test the... SC Test the... SC 6

Story-maps

- The main purpose of story mapping is to understand the end-to-end user requirements and stitch them in a logical thread so that users get maximum return on the business value
- Benefits of Story-maps
 - Overall workflow of the system help in understanding value chain.
 - Relationship between large stories and child stories get established
 - Completeness of backlog can be validated
 - A basis of prioritization
 - Helps in release planning

Agile Modeling

Tools & Techniques / Agile Analysis & Design

- Agile Modeling (AM) is a practice-based methodology for **effective modeling** and **documentation** of software-based systems.
- At a high level AM is a collection of best practices, depicted in the pattern language map below.
- At a more detailed level AM is a collection of values, principles, and practices for modeling software that can be applied on a software development project in an effective and light-weight manner.

Agile Design Principles

Tools & Techniques / Agile Analysis & Design

There are 5 principles of Agile design named as SOLID.

- **Single Responsibility Principle:** A class should have only one reason to change
- **Open Closed Principle :** Classes, modules and functions should be open for extension but closed for modification
- **Liskov Substitution Principle:** Derived types must be completely substitutable for their base types.
- **Interface Segregation Principle:** Client should not be forced to depend upon interfaces that they don't use
- **Dependency Inversion Principle:** High level modules should not depend on low level modules. Both should depend on abstractions. Abstractions should not depend on details. Details should depend on abstraction.

Agile Chartering

Tools & Techniques / Agile Analysis & Design

Agile chartering is done before Release Planning. The main purpose of the project chartering is to establish a vision, goal and high level requirements. Agile charter like traditional project charters establish

- The purpose of project (why we are doing it)
- What we want to achieve
- Success criteria of project
- Role of senior people engaging in the project

Cost of Quality

Cost of conformance

- Appraisal Costs
 - checking & Testing Purchased Goods
 - In-process and Final Inspection Testing
- Field Testing
- Product, Process and Service Audits
- Calibration of Measuring and Test Equipment
- Prevention Costs
 - Capability Evaluation
 - Error Proofing
 - Quality Planning
 - New Product Review
 - Quality Improvement Project
 - Quality Education and Training
 - Supplier Evaluation

Cost of nonconformance

- Internal Failure Costs
 - Re-design
 - Downtime
 - Re-testing
 - Shortages
 - Delays
 - Rework
 - Lack of flexibility
- External Failure Costs
 - Environmental Costs
 - Loss due to Sales Reductions
 - Warranties
 - Repairing Goods
 - Complaints

Definition of Done (DoD)

- The DoD changes over time. Organizational support and the team's ability to remove impediments may enable the inclusion of additional activities into the DoD for features or sprints.
- Continuous Integration (CI) helps you validating the “Doneness”
- There are 3 level of DoD
 - Story DoD
 - Iteration DoD
 - Release DoD

Definition of Done (DoD)

Story “Done”

- Unit test should provide 60-70% test coverage
- Story is either written in pair or reviewed by peer
- All code checked in
- All unit code passed
- All acceptance test case passed
- Story accepted by owner

Vedavit

Definition of Done (DoD)

Iteration “Done”

- Iteration should have defined Iteration Goal
- All acceptance test cases should run for all user stories in Iteration
- All stories completed must be accepted by the product owner
- Defects identified are fixed or planned for future
- Code performance is tested and accepted
- If database is involved then database script should be available, automated and tested
- Backup of iteration work product is taken

Definition of Done (DoD)

Release “Done”

- Release should have defined Release Goal
- Product has formal release date
- Product is deployed on staging area
- Stress testing done and results accepted
- All non-functional requirements are tested and results accepted
- Required documentation is available
- Release should not have any known bug

Vedavit

Feedback Techniques of Agile Project Management

Tools & Techniques / Product Quality

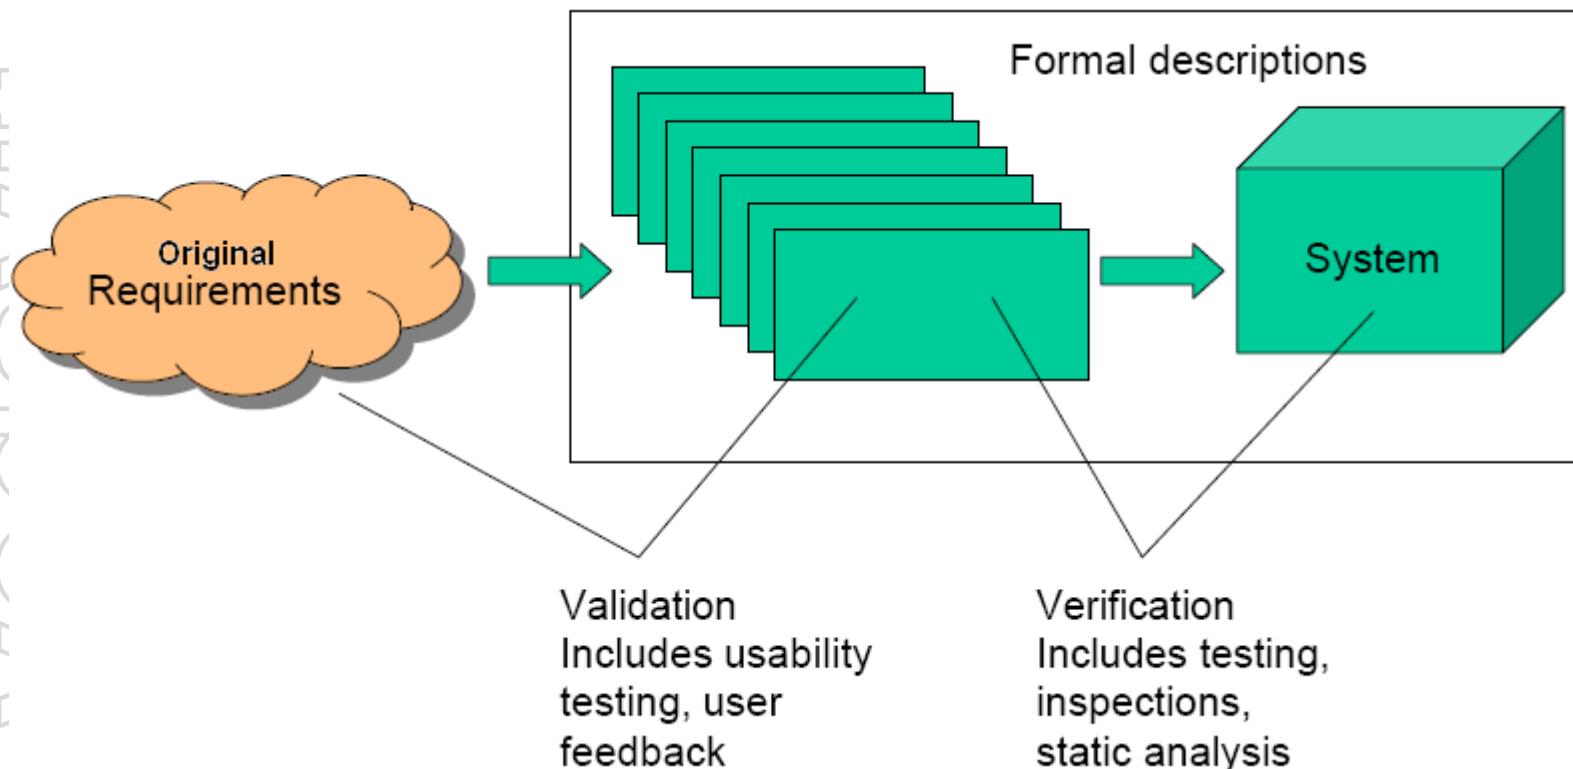

Timely & regular feedback is heart beat for producing a good quality product and managing risks. Following techniques are used to get quick feedback.

- Release planning
- Sprint planning
- Daily stand-up
- Sprint review
- Sprint retrospective
- Pair programming
- Peer review
- Customer involvement throughout PLC

Verification and Validation

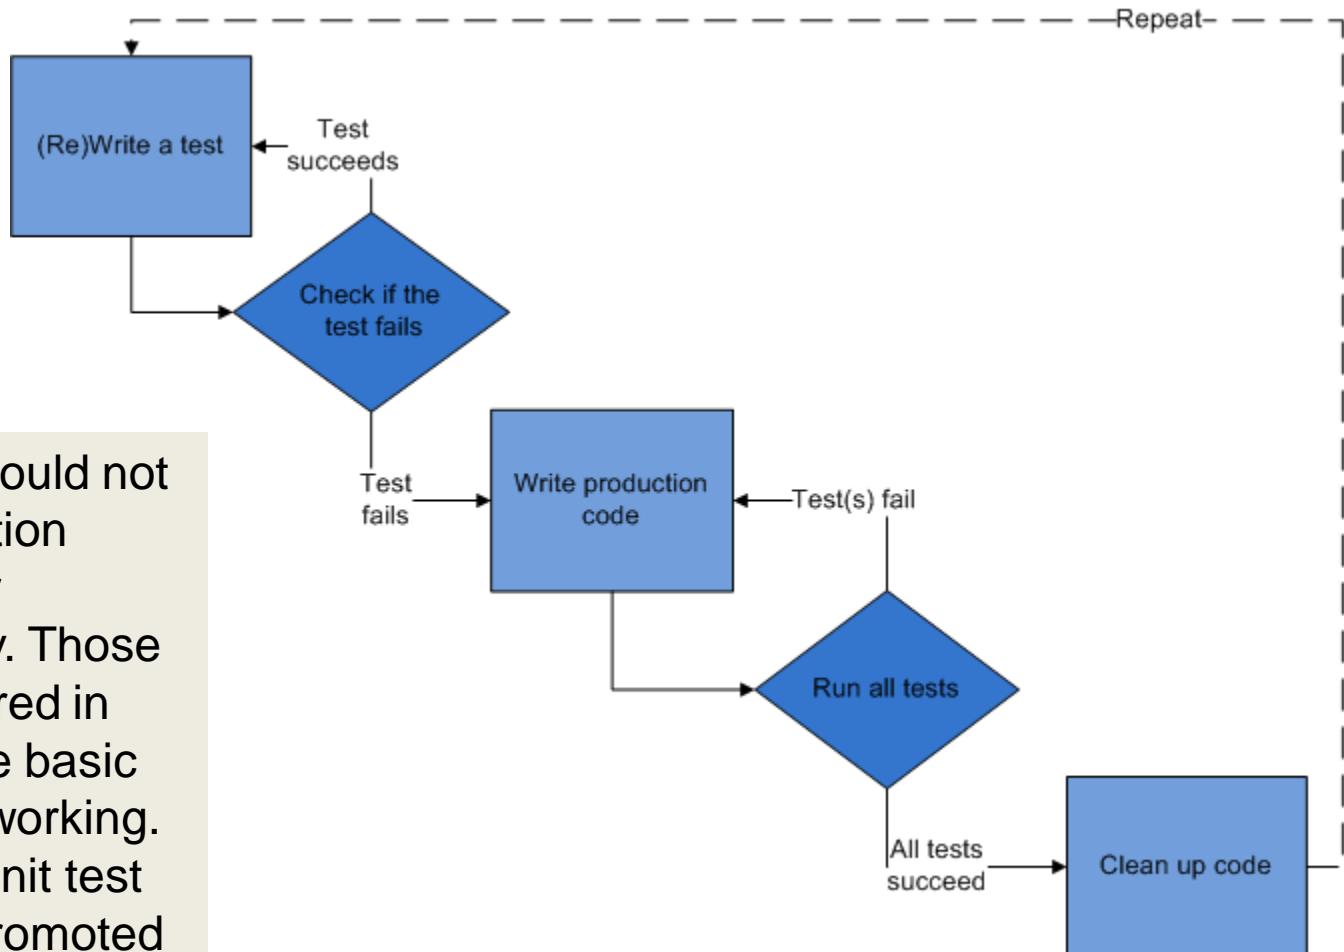

Tools & Techniques / Product Quality

- Validation:
 - How close is **Product** with respect to original requirement
 - Building the right things
- Verification:
 - How close is product built **Process** with respect to defined and agreed
 - Building the things right

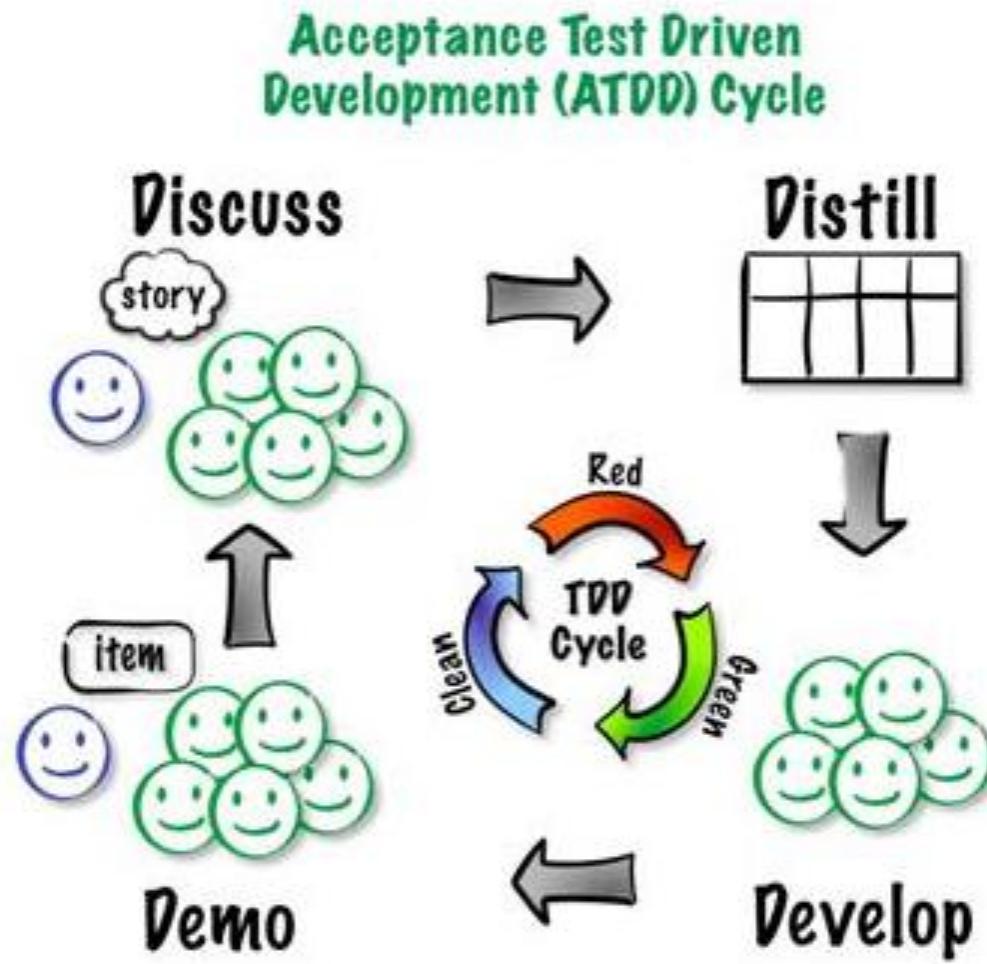

Test Driven Development (TDD)

- Programmer should not consider exception cases and error handling initially. Those can be considered in next cycle, once basic functionality is working.
- If built passes unit test then only it is promoted to the next step as a candidate for acceptance test build

Acceptance Test Driven Development (ATDD)

- Major difference between ATDD and TDD is in ATDD user story or **functionality is tested** not the task like in TDD.
- Using ATDD practice you are not allowed to add more functionality until earlier user stories are successful.
- Collection of acceptance test cases forms regression test and it should run automatically on built server

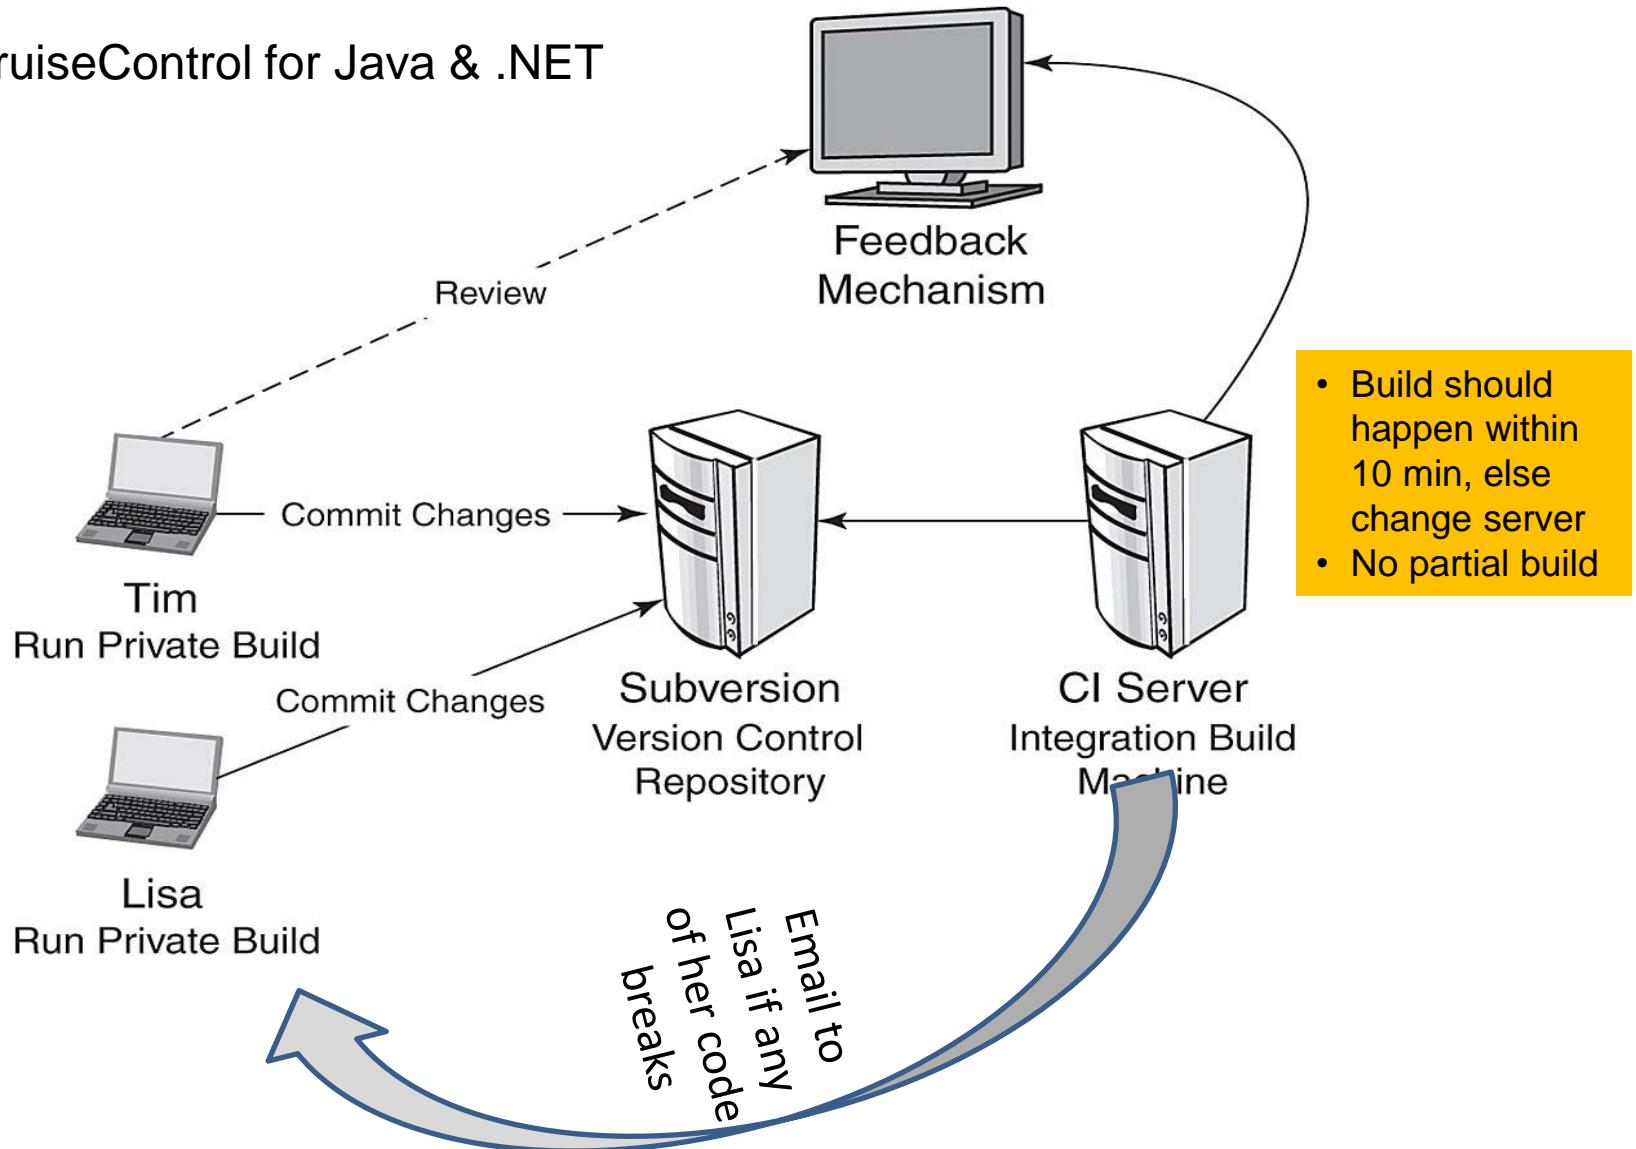

Exploratory Testing

- After acceptance test cases are passed then Agile tester may choose to perform exploratory testing
- In exploratory testing agile tester tests those scenario which system user is not supposed to perform but if he perform in that case system should give proper message.

Continuous Integration

Tools & Techniques / Product Quality

Tool: CruiseControl for Java & .NET

Continuous Process Improvement

Tools & Techniques / Product Quality

Models for Continuous Process Improvement

- PDCA Cycle (by Juran - “Fitness for Use”)
- Score Card
 - Escaped defects, Overtime, Velocity, Cost, Time
- Balance Score Card (BSC)
 - Four aspects of BSC are Financial, Customer, Internal Business Proceeds, Learning and Growth
- Six Sigma (DMAIC)
 - Motorola in 1985
 - Used widely by Jack Welch @ GE in 1995
- Kaizen
- Eliminating the waste
- Kanban

7 Wastes

Tools & Techniques / Product Quality

TIM WOOD

The 7 Wastes

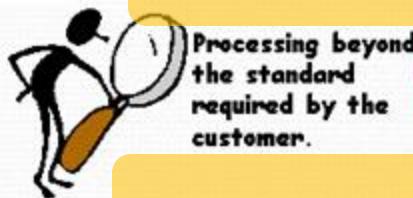

MUDA

is the Japanese word for WASTE.

Defect

Over Processing

Defect

Non right first time.
Repetition or correction of a process.

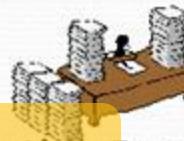

Transportation

Unnecessary movement of people or parts between processes.

Copyright TE 2010

Overproduction

To produce sooner, faster or in greater quantities than customer demand.

Inventory

An 8th waste is the wasted potential of people

Raw material, work in progress or finished goods which is not having value added to it.

Waiting

People or parts that wait for a work cycle to be completed.

2

3

4

Motion

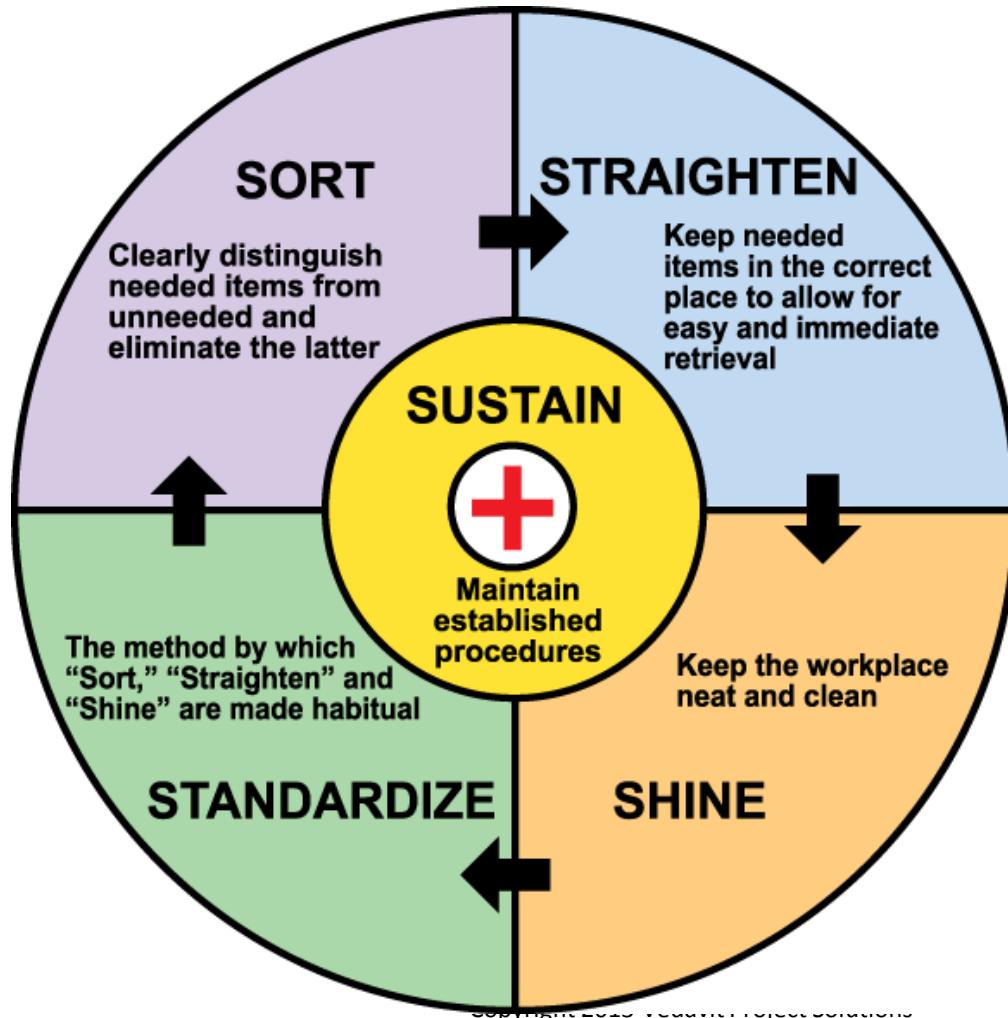

Unnecessary movement of people, parts or machines within a process.

House Keeping Standard (5S)

Tools & Techniques / Product Quality

- In Lean 5S is foundation tool for continuous improvement.
- 5S is also called house keeping standard because it lists down the steps to organize a work space for efficiency and effectiveness by identifying and storing the items used, maintaining the area and items, and sustaining the new order.

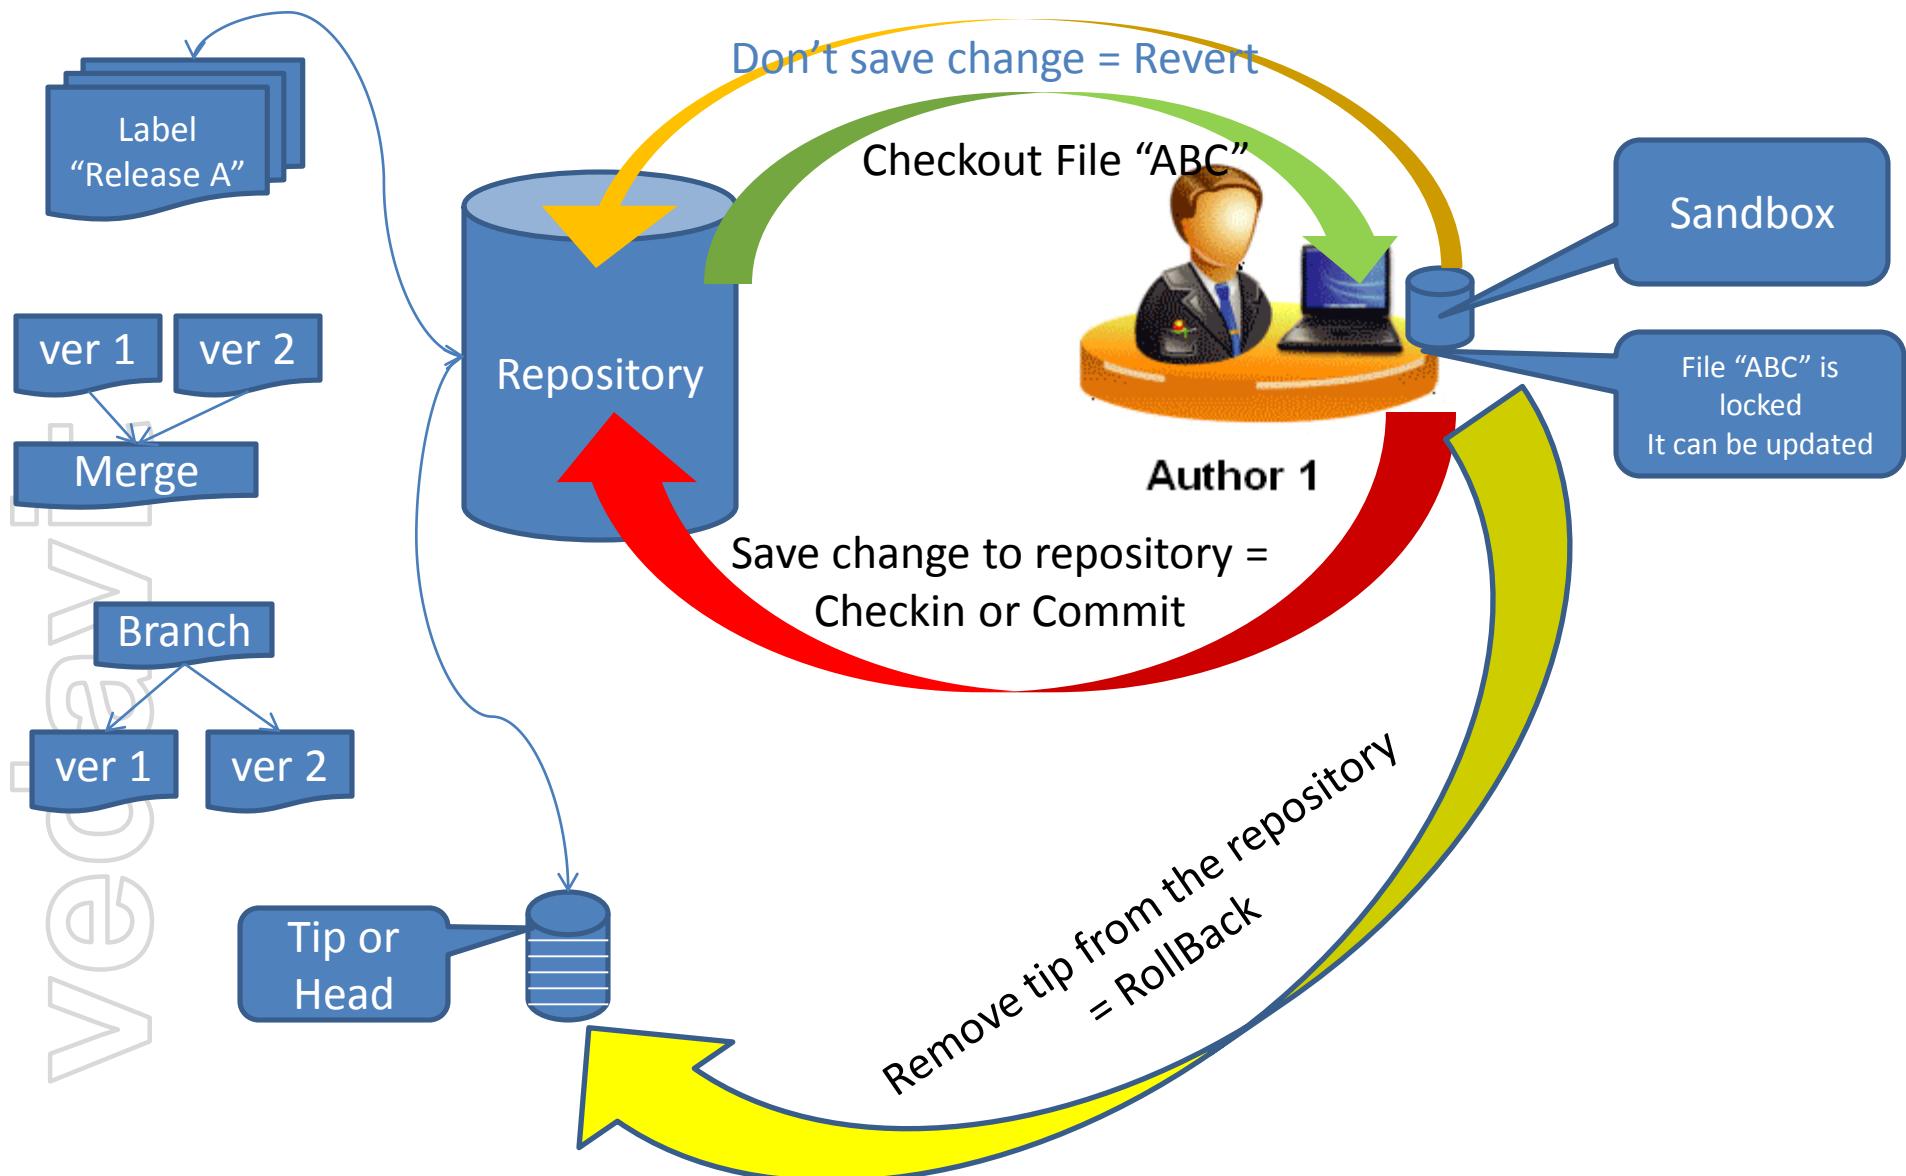

Version Control

- A **version control system** is a repository of files and source code, with monitored access. Every change made to the source is tracked, along with who made the change, why they made it, and references to problems fixed, or enhancements introduced, by the change. This is very important tool to ensure quality product.
- **Collective code ownership** means whole team takes responsibility of the quality of the code therefore anybody can modify the code, if needed. (Encouraged in XP Agile Method)
- **Strong code ownership** means each person owns his module. Only he can make changes to his module.
- **Weak Code Ownership** means one person write the module but another person can make changes as long as owner helps them or they coordinate with owner
- When two users can update the same code at same time is called **Concurrent editing**. Conflict is resolved using merging method.

Version Control

Tools & Techniques / Product Quality

Agile Tooling Mistake

For producing a good quality product agile project management relies heavily on automation. Therefore not investing in tools or using legacy tools for agile project management affects the moral of the team and quality of the product

Generally following mistakes are made by organization in agile tooling

- Using old version of tool which were working for waterfall
- Not investing on automation tool still continuing manual testing, documentation etc
- Working on age old slow hardware, while team is wasting time
- Not investing time on continuous-integration tool
- Using traditional waterfall metrics to manage the project
- Performing continuous integration only on mainline not on branch so branch code becomes buggy and unreliable.

Typical Software Tools in Agile Projects

- Agile project management systems (APMS) for effective communication and providing bird's eye view of the project
 - Rally, VersionOne, Jira
- Testing Tools to achieve 100% code coverage by auto unit testing.
 - xUnit
- Regression Testing Tool
 - CruiseControl, TFS
- Version Control to mange versions of code, product, test-case, tested product
 - SVN, SourceSafe, TFS

 17. Servant Leadership

Emotional Intelligence

- Emotional intelligence (EI) is the ability to identify, assess, and control the emotions of oneself, of others, and of groups
- One of the values of agile project management is “**Individuals and interactions over processes and tools**”. Thus the project success heavily depends upon people management

Self Organizing Team

- Agile team is a team of highly self motivated, organized, disciplined individuals. They manage complete project without any extra motives. The team has strong will to make project successful.
- In all project activities like planning, execution, monitoring, adapting they participate willingly, and live with values and principles of Agile manifesto.
- No work is assigned to agile team members but they identify the most important task to deliver maximum business value in planning sessions and picks up the task on their own while sprint work is on.
- When the team was previously commanded and controlled, the general tendency is to wait for instructions than figuring out ourselves. This is anti-pattern of self-organizing team. It is very difficult to build a self organizing team under the same leadership, who used to command and control earlier

Shu-Ha-Ri

Shu-Ha-Ri is Japanese term according to this a student or team goes through three stages of learning. Whatever you teach them it takes time to master the art. Three stages are

- Shu: This is the initial obedient stage, when the student just follows the rules.
- Ha: The student questions the rules, understands their importance, and makes innovations within the rules.
- Ri: The student breaks the rules and creates his own rules, thereby escalating to the master level.

Active Listening

Tools & Techniques / Soft Skills

"Listen what I mean, not what I say" But how to do that?

Words are used for communication and if people are not choosing right words for communication due to poor subject understanding, poor grip on the language in which they are communicating, hidden intention or any other reason then how to listen them?

To Actively Listen you should

- Pay Attention
- Show that you're listening
- Provide verbal and non-verbal feedback
- Defer Judgement
- Respond Appropriately

Acronym for listen can be

- L - Look Interested - get interested
- I - Involve yourself by responding
- S - Stay on target
- T - Test your understanding
- E - Evaluate the message
- N - Neutralise your feelings

Collaboration

- Collaboration is animated two way conversation with real understanding and progress happening. Collaboration means whole is more than the sum.
- Eight agile practices which helps team and stakeholders in effective collaboration are
 - **Trust** => to thrive on relations
 - **Sitting together** => for quick and accurate communication
 - **Real customer involvement** => to make sure that team understand what to build
 - **A ubiquitous language** => to help team members, customer understand each other
 - **Stand up meeting** => to keep team member informed
 - **Coding standards** => to seamless integrate the work of individual's work
 - **Iteration demos** => to keep the team's efforts aligned with stakeholder goals
 - **Reports** => to help reassure the organization that the team is doing well

Adaptive Leadership

- Organization does not work in incubator but in volatile, fragile, competitive world. It is not possible to deliver results if we do not learn from mistakes, accommodate change request or changed condition. It is impossible to know everything before we start.
- Adaptive leadership pays attention to **value delivery, flexibility, fluidity, cooperation, reprioritization, simplicity, self-organizing, local decision making, innovation, lifelong learning, discuss diverse and divergent views.**

Interpersonal Skills of a Project Manager

Tools & Techniques / Soft Skills

Ability to establish and maintain relationships with other people

1. Leadership
2. Team Building
3. Motivation
4. Communication
5. Influencing
6. Decision Making
7. Political and Cultural Awareness
8. Negotiation
9. Trust Building
10. Conflict Management

7. Learning & Working
8. BART Analysis
9. Teams Self Assessment Chart
10. Servant Leadership

Agile Team

- Agile team is smaller compare to Waterfall team size
- Scrum suggests team size of 7 ± 2 . But maximum team size recommended in Agile is 20
 - If you need to add more resource than add more experienced people rather adding junior people
 - If you further need to add more team member then use agile scaling principle

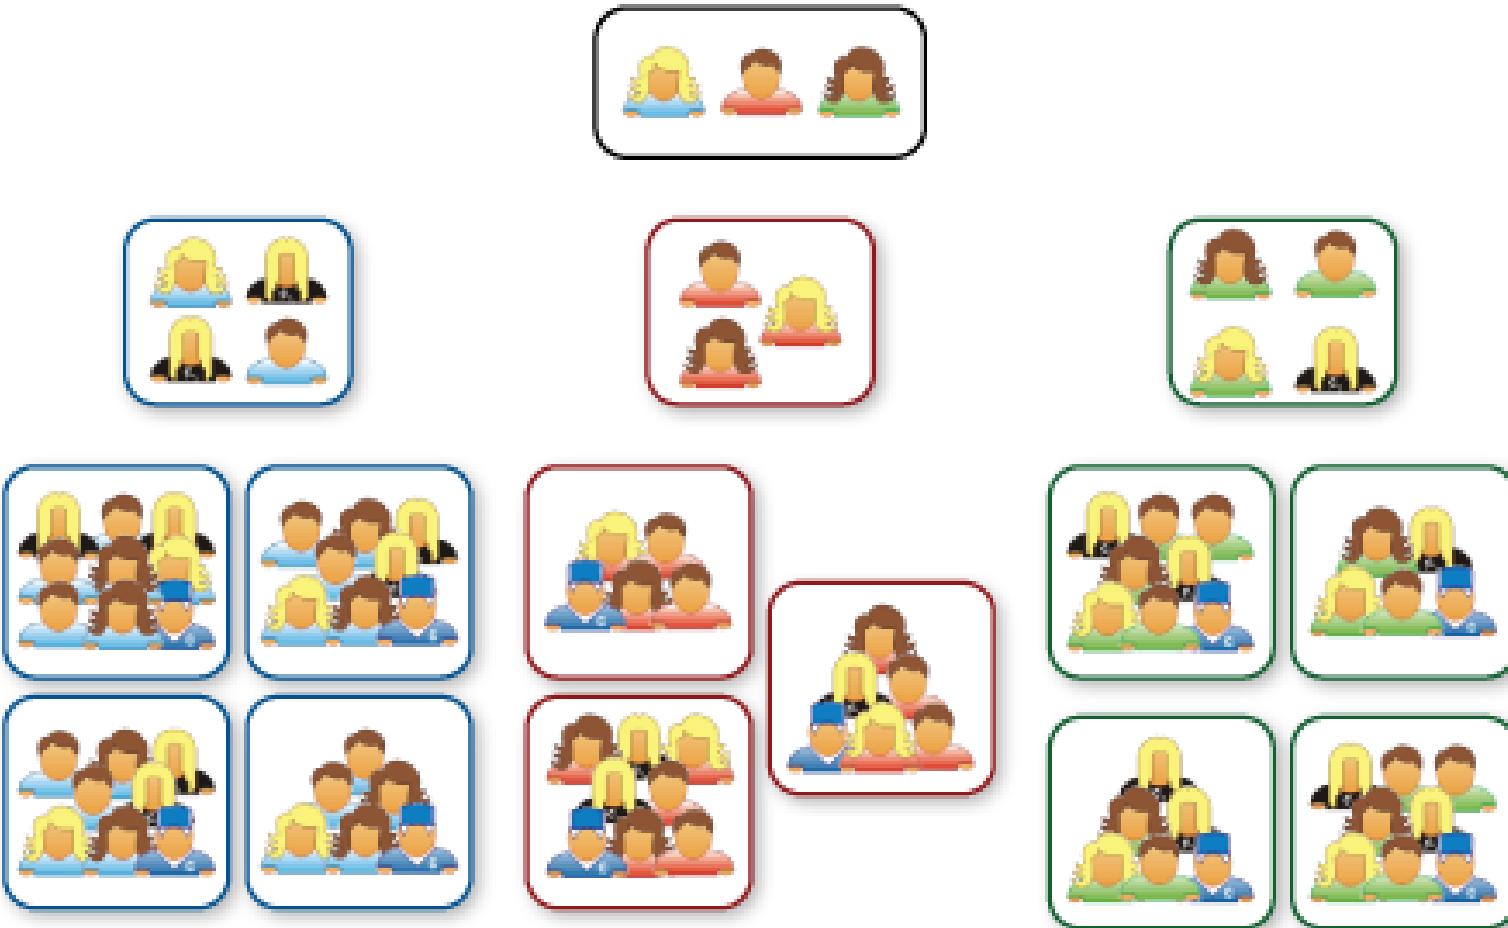

Agile Team Scaling

- Create feature team (vertical team) do not create skill wise (horizontally).
- Create high level scrum of scrum teams
- Everyday standup meeting is joined by one designated person from each team
- Extra four questions for Scrum of Scrum Daily Standup meeting
 - What has your team done since we last met?
 - What will your team do before we meet again?
 - Is anything slowing your team down or getting in their way?
 - Are you about to put something in another team's way?

vedavit

Agile Team Scaling

Tools & Techniques / Soft Skills/ Team Management

Type of Teams

	Manager lead team	Self-managing team	Self-organizing team	Self-governing team
Setting overall direction for the team				
Designing the team and its context				
Managing work processes and monitoring progress				
Executing the team task				

Vedavit

5 Stages of Team Development

Tools & Techniques / Soft Skills

- Forming
- Storming
- Norming
- Performing
- Adjourning

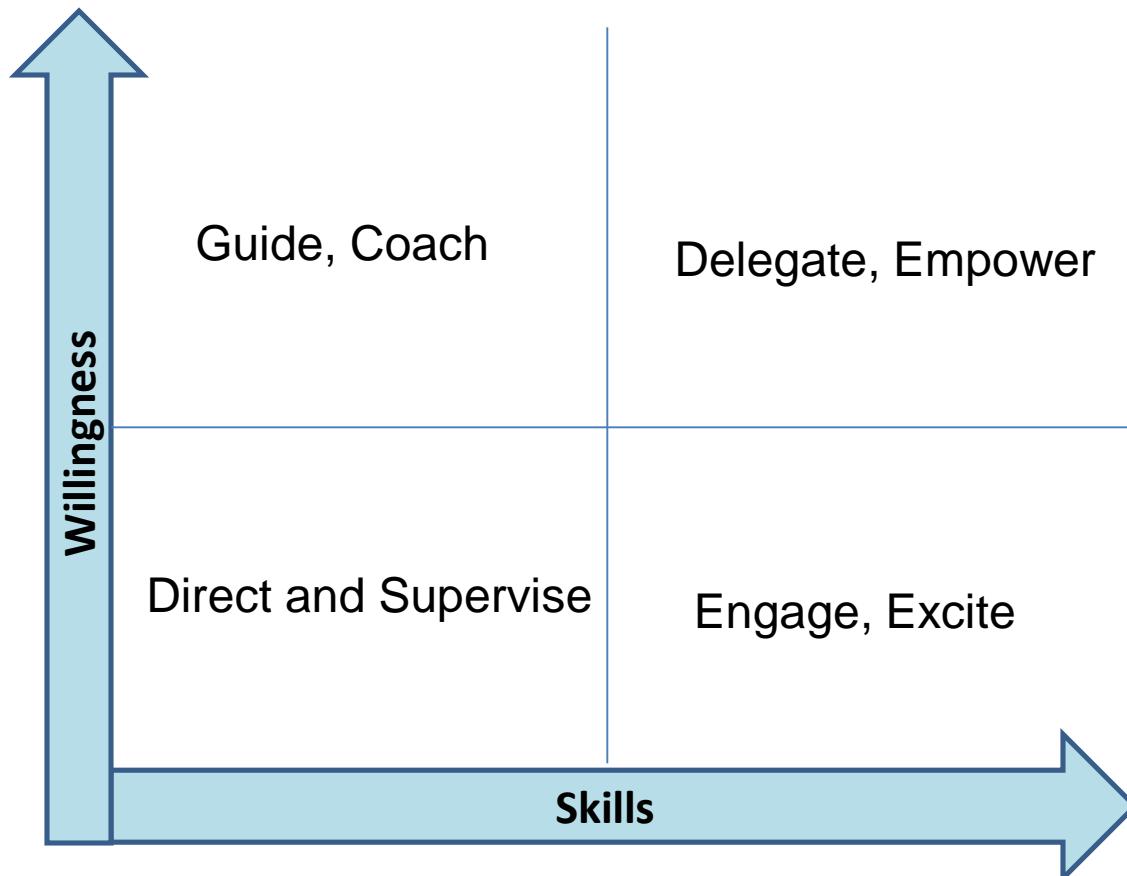

Vedavit

Ground Rules

- Layout ground rules which helps in team building, keeping the team intact as a whole, no partiality to anyone. Do not encourage heroic attitude. Team as a unit rise and fall not individual.

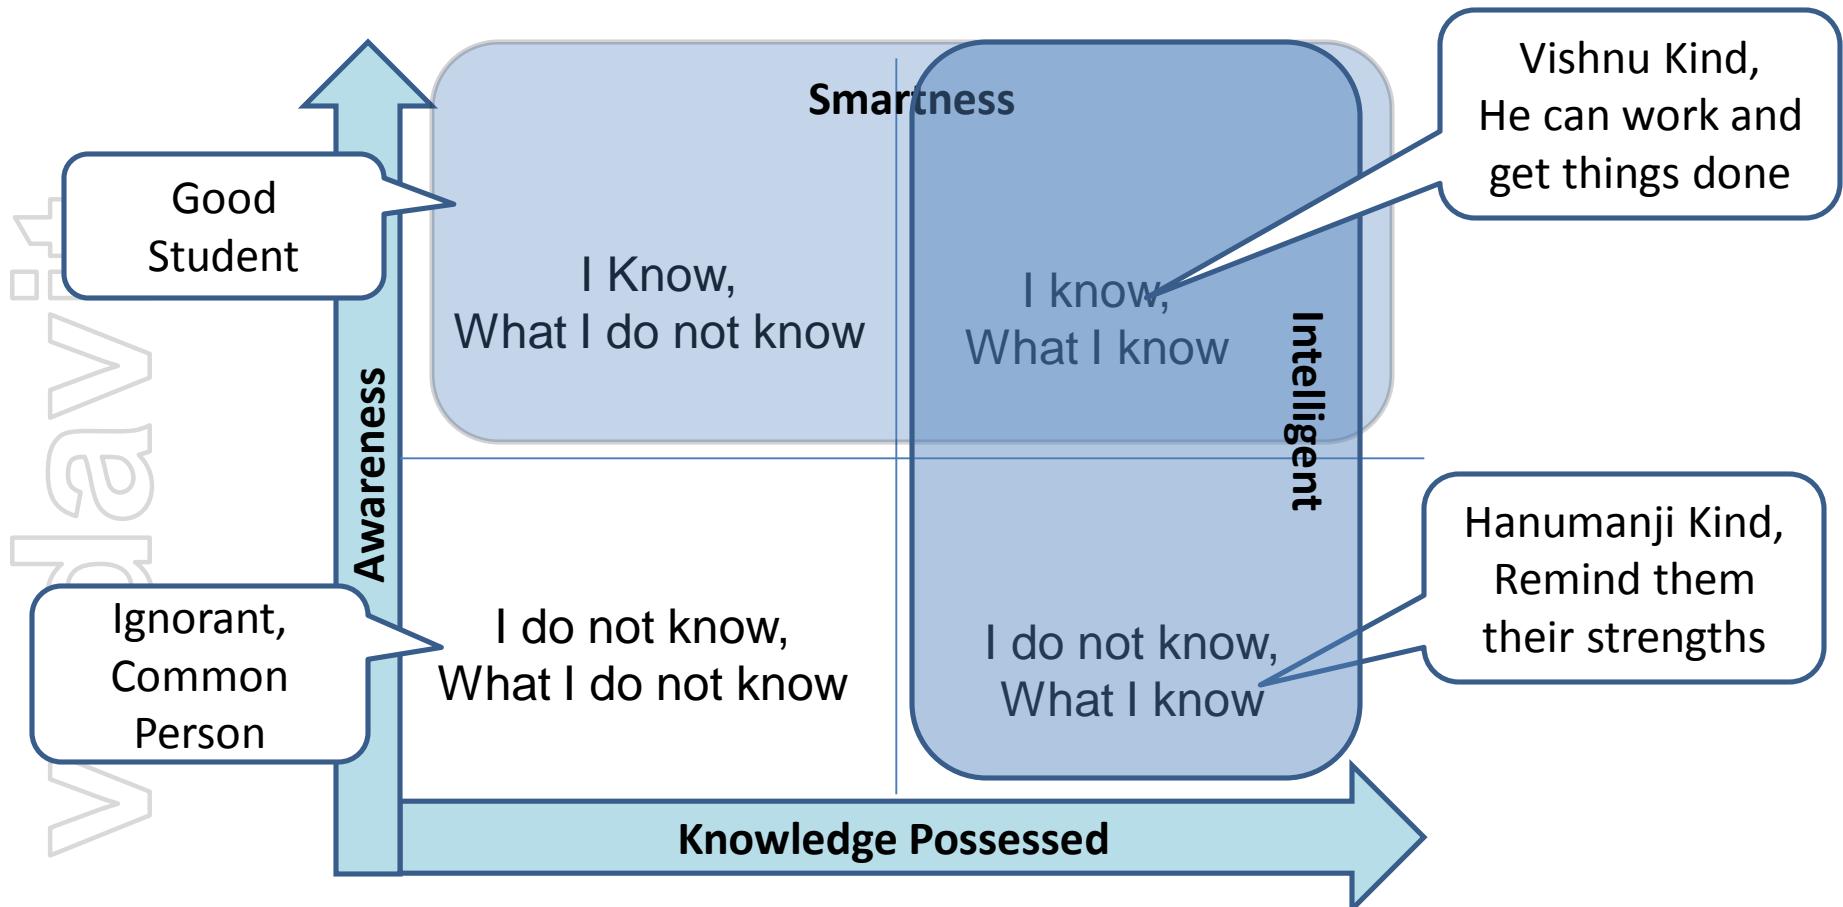

Mentoring & Coaching Style

- Agile coaching is 40% doing and 60% being
- At the start of iteration or release team level coaching takes high importance
- In between the sprint or release individual level coaching takes high importance

Learning & Working

- You can coach, guide, teach only to a good student
- You can guide and inspire only to Hanumanji Kind person
- Vishnu kind are leader, you need to give them vision and they can manage everything

BART Analysis

- Boundary, Authority, Role and Task (BART)
- When people assemble to do work, clear definitions of Role, Task and Authority are essential.
- Unclear definitions of these items leads to all sorts of waste.
- Scrum's very clear Roles and associated Tasks and Authority are a big part of what makes actually Scrum 'tick'.
- A Boundaries 'collection' is an attribute of the Role, Task and Authority 'objects'. Boundaries can come in many forms, including: boundaries of time, boundaries in terms of access to resources, etc.

Team Self-Assessment Chart

when people assemble to do work

Performance	Above Standard			Iteration4
	At Standard	Iteration2	Iteration3 Iteration5	Iteration6
	Below Standard	Iteration1		
		Below Standard	At Standard	Above Standard

Servant Leadership

Tools & Techniques / Soft Skills

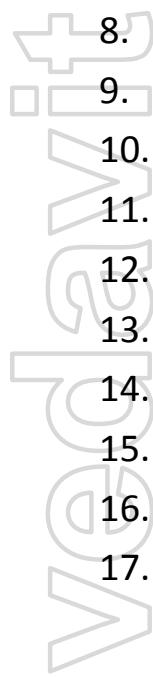

Leadership style where leader's focus is on creating conducive environment of performance and removing impediments. He works as fire wall for team and keep them away from day to day other distraction.

Characteristics of Servant Leader

- Listening
- Empathy
- Healing
- Awareness
- Persuasion
- Conceptualization
- Foresight
- Stewardship
- Commitment to the growth of people
- Building Community

Value by Definition

www.businessdictionary.com

- **Accounting:** The **monetary worth** of an asset, business entity, good sold, service rendered, or liability or obligation acquired.
- **Economics:** The **worth of all the benefits** and rights arising from ownership. Two types of economic value are (1) the utility of a good or service, and (2) power of a good or service to command other goods, services, or money, in voluntary exchange.
- **Marketing:** The **extent to which a good or service is perceived** by its customer to meet his or her needs or wants, measured by customer's willingness to pay for it. It commonly depends more on the customer's perception of the worth of the product than on its intrinsic value.
- **Mathematics:** A **magnitude** or quantity represented by numbers.

www.en.wikipedia.org

- In philosophy, value is a **property of objects**, including physical objects as well as abstract objects (e.g. actions), representing their degree of importance or worth.[citation needed] The study of it is included in value theory.
- An object with **philosophic value** may be termed an ethic or philosophic good.
- Types of values include **ethical/moral values, doctrinal/ideological** (religious, political) values, **social values**, and **aesthetic** values. Values have been studied in sociology, anthropology, social psychology, moral philosophy, and business ethics.

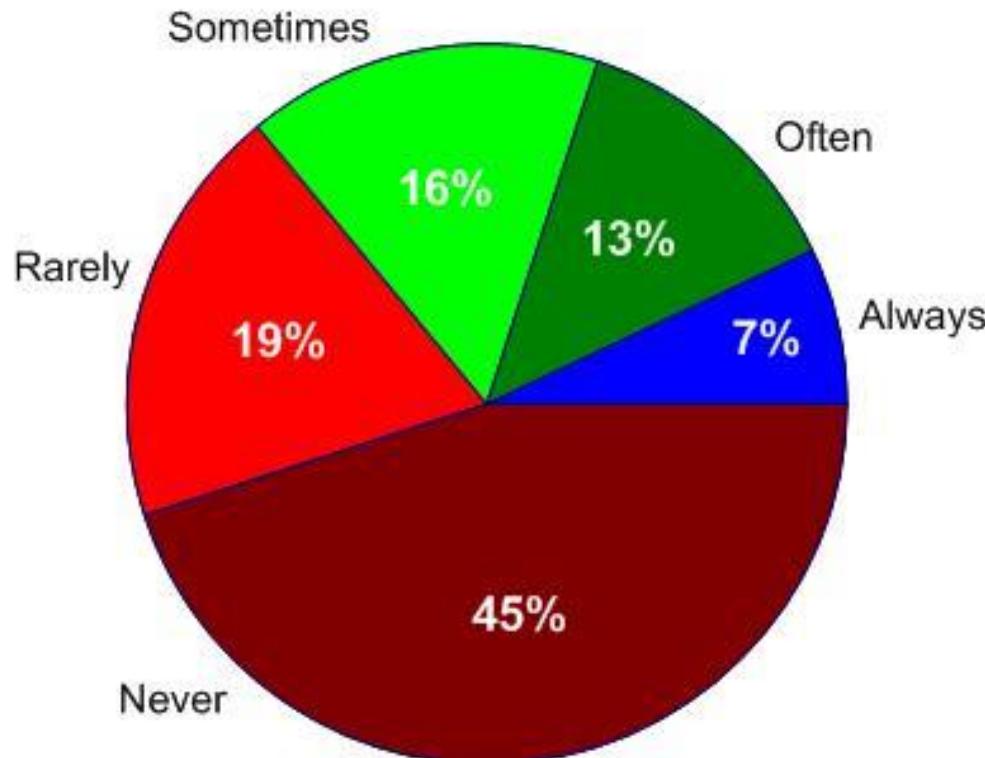

What is Value?

- Worthiness of something in these eyes of customer.
- Quality, Timely Delivery, Comfort Realized, Pain Reduced are various dimension of Value

Vedavit

Value of Delivered and non-used Features

Average percentage of delivered functionality actually used when a serial approach to requirements elicitation and documentation is taken on a “successful” information technology project.

Source: Chaos Report v3, Standish Group.

JIT in Value Delivery

Tools & Techniques / Value Based Prioritization & Value Streaming

Your customer asks you to develop an application with 50 features, out of these 10 are business critical. Application will be ready in 12 months. You are in 3rd week in the project and ask these questions to yourself

- ✓ What is the value of detail plan of this whole application?
- ✓ What is the value of hiring those resources/expertise which you need after 6 month (that too not sure)?
- ✓ What is the value of detail design, SRS, Functional specification (especially when you know they are going to change)?
- ✓ What is the value of writing test cases for complete application?
- ✓ What is the value of hardware, software, infrastructure which you do not need today?

JIT (Just In Time) principle helps controlling our greed and maximizing value.

Companies like Toyota, Dell start using this concept early in the industry.

Sources of Revenue

- Incremental Revenue
 - Comes from existing customer
- New Revenue
 - Comes from new customer
- Retained Revenue
 - Comes by enhancing the existing feature. But if you do not enhance features then customer will buy other product.
- Operational Efficiency Revenue
 - Comes by improving operational process

vedavit

Value Evaluation Techniques

These techniques are also called a Project Appraisal Methods

- Present Value (PV)
 - Present value of money which business will realize in future
 - $PV = FV/(1 + r)^n$; n is number of years, r is discounted rate, FV is future value.
- Net Present Value Method (NPV)
 - In the NPV method, the revenues and costs of a project are estimated and then are discounted and compared with the initial investment.
 - The preferred option is that with the highest positive net present value.
 - Projects with negative NPV values should be rejected because the present value of the stream of benefits is insufficient to recover the cost of the project.

Value Evaluation Techniques

- Discount rate
 - The discount rate is a concept related to the NPV method. The discount rate is used to convert costs and benefits to present values to reflect the principle of time preference.
- *Benefit cost Ratio (BCR) or Return on Investment (ROI)*
 - $BCR = Benefit / Cost$ ratio
 - The BCR is the discounted net revenues divided by the initial investment. The preferred option is that with the ratio greatest in excess of 1

Value Evaluation Techniques

- Internal Rate of Return (IRR)
 - The IRR is the discount rate which, when applied to net revenues of a project sets them equal to the initial investment.
 - The preferred option is that with the IRR greatest in excess of a specified rate of return.
- Payback Period (PB)
 - Amount of time in which original investment will be realized through business returns
 - The preferred option is that which the lowest PB

Value Based Analysis (VBA)

Tools & Techniques / Value Based Prioritization & Value Streaming

- Value Analysis (VA)
 - Identify the product and its end users
 - Identify the basic functions for which customer is planned to be billed (primary function)
 - How the above function to be achieved (secondary functions)
 - Relatively prioritize primary and secondary functions
 - Build high value functions first
- Value Stream Analysis (VSA)
 - Focus of this techniques is to eliminate the waste and achieve same functionality at less cost with better quality and performance
- Value Proposition (VP)
 - VP is generally a clear statement of unique value creating features, utility and tangible results perceived by the customer. VP is the reason due to which customer considers vendor A compare to vendor B
- McKinsey Shared Value Model
 - It helps to achieve shared values through 7S
 - Strategy, Structure , Style, Skills, Staff, System, Shared Values

Minimum Marketable Features (MMF)

Tools & Techniques / Value Based Prioritization & Value Streaming

Product is saleable or usable or viable only when a set of minimum number of features is built there in the product. Generally all these features are part of a single release. This is called MMF.

Epic: Personal Information	Epic: Login/Logoff	Epic: User Management	Epic: Multi-Order Shipping	Epic: Basic Shipping	Epic: Priority Shipping	Epic: Shipping	Epic: Shopping	Epic: Payment Methods	Epic: Order Management

MMF

VCE

Non Functional Requirements

Tools & Techniques / Value Based Prioritization & Value Streaming

1. 13 Non-functional Requirements
2. Non-functional Requirements and Value Prioritization

13 Non-Functional Requirements (NFR) with example

Tools & Techniques / Value Based Prioritization & Value Streaming/ Non Functional Requirements

- 
1. Performance: *100 transactions per minute*
 2. Interface: *capable of importing data with EDI format*
 3. Operational: *must not require more than 1 megabyte of main memory*
 4. Resource: *will use wireless encryption algorithm that is “better” than WEP*
 5. Verification: *all data updates must be traceable*
 6. Acceptance: *must pass a user defined system test bucket*
 7. Documentation: *user manual is needed for novice users only*
 8. Security: *user request to access any data must be authorized first*
 9. Portability: *the system must operate with “any” relational db systems*
 10. Quality: *the system must install with zero defect*
 11. Reliability: *the system must be accessible 99.9 % of the time*
 12. Maintainability: *the system must be modifiable (e.g. designed with exits)*
 13. Safety: *the system must not perform “chemical material discard” functions without “explicit” user authorization.*

Non-functional requirements and Value Based Prioritization

- Non functional requirements of a product and Requirement of infrastructure required to manage the project are considered as Technical user story.
- Infrastructure related user stories are completed earlier
 - Other non-functional requirements are implemented later in release

vedavit

Relative Prioritization & Ranking Methods

Tools & Techniques / Value Based Prioritization & Value Streaming /Relative Prioritization & Ranking Methods

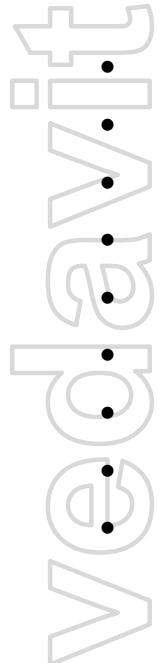

1. Prioritization
2. Customer-valued Prioritization
3. Forced Ranking Technique
4. Analytical Hierarchical Process
5. Paired Comparison Techniques
6. Weight-based Prioritization Techniques
7. Kano Analysis
8. 100 Point Method

Relative Prioritization & Ranking Methods

Prioritization

Agile project management is based on principle of **incremental delivery** and **deliver fast**. Thus we must know the prioritization methods so that we can deliver high business values items earlier.

Possible Factors of prioritization are as below. Each factor may have different weightage (business value has highest weightage) when you prioritize your product backlog items.

- 
- Business Value
 - Cost of Implementation
 - Prioritization Scenario
 - Implementation Time
 - Frequency of usage
 - Safety
 - Implementation Difficulty
 - Stability
 - Re-usability

Relative Prioritization & Ranking Methods

1 Customer Value Prioritization

- Customer based on input from internal stakeholders assigns some priority to each requirement

2 Forced Ranking Techniques

- Force customer to assign unique rank number to each requirement

Requirements	Stakeholder1	Stakeholder2	Stakheolder3	Total	Ranking
Req#1	1	5	4	10	2
Req#2	2	4	5	11	1
Req#3	3	3	3	9	3
Req#4	4	1	2	7	5
Req#5	5	2	1	8	4

Relative Prioritization & Ranking Methods

Tools & Techniques / Value Based Prioritization & Value Streaming /Relative Prioritization & Ranking Methods

3 Analytical Hierarchical Process (AHP)

- Relative prioritization comparing feature pair wise

4 Paired Comparison Techniques

- Like AHP but priority can only 0 or 1

Requirements	Req#1	Req#2	Req#3	Req#4	Req#5	Total	Ranking
Req#1	0	1	1	1	1	4	1
Req#2	0	0	1	1	1	3	2

17. Understanding Reserves

What is Risk?

- Risk is an event which has probability of happening in future and it can have negative or positive impact on the objective of the project
- Risk itself is not negative or positive. Risk is perceived as negative or positive based on its impact on the project's objectives.

vedavit

Risk Attitude

- Risk Seeker
 - They look for opportunities to get more return
- Risk Neutral
 - They do not look for opportunity but if something comes on the way and they are getting corresponding returns for this then they take risk
- Risk Averse
 - They are very conscious about the risk and they do not want to take risk.

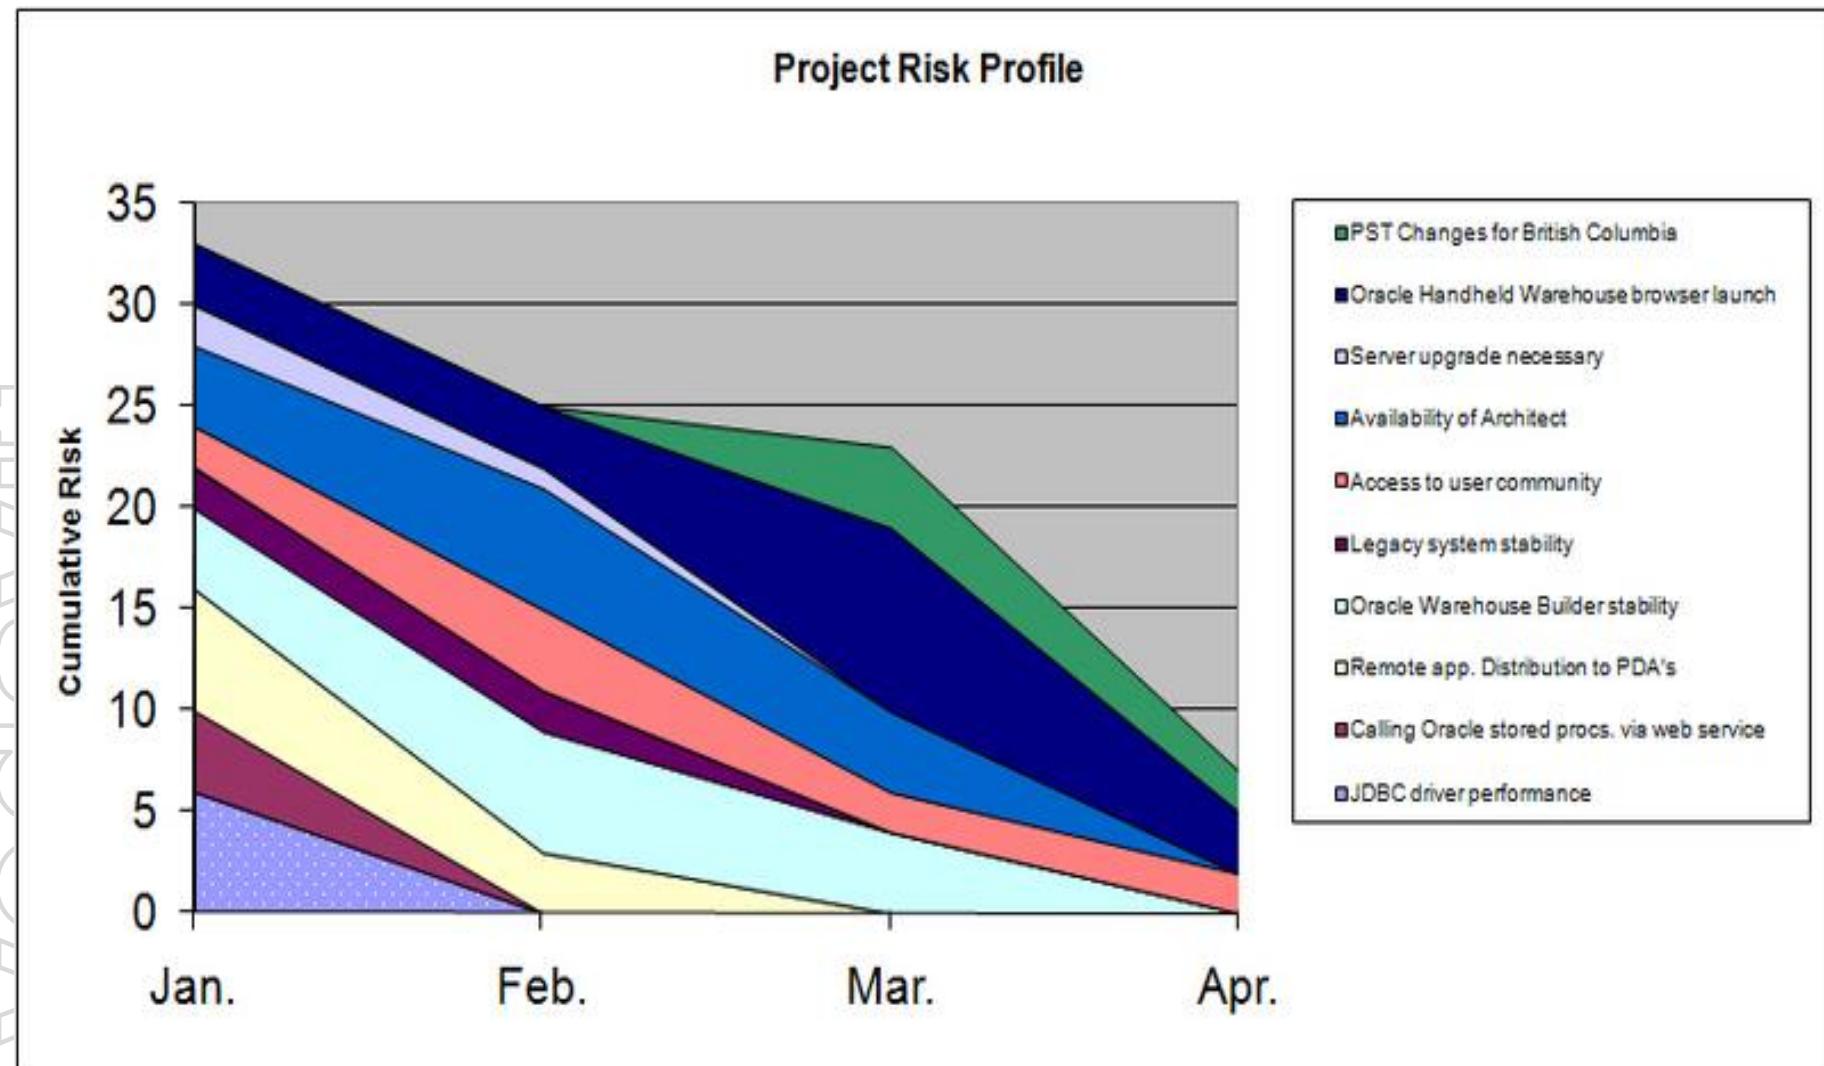

Risk Management Terminologies

- Assumptions, Dependencies, Constraints are **root cause of risk**
- **Sources of risks** : Depending upon business domain of the project its sources may be technology, skills, resource availability, project management practices etc.
- **Proximity of risk** : In future how soon risk is going to occur
- **Risk Area**: What are geographies, department, components, services, server etc. will be affected by the risk
- **Risk Urgency** : If it occurs how soon it will impact the project objective: immediately, in short run, in long run

Plan Risk Management

- Setup Risk Management Framework
- Identify tools & templates
- Conduct awareness training for risk management activities
- Establish responsibilities for Risk Management Activities
- Establish risk reporting formats and frequency
 - Determine who will conduct risk audit and when
 - Define risk attitude and risk appetite of key stakeholders

Project Risk Profile

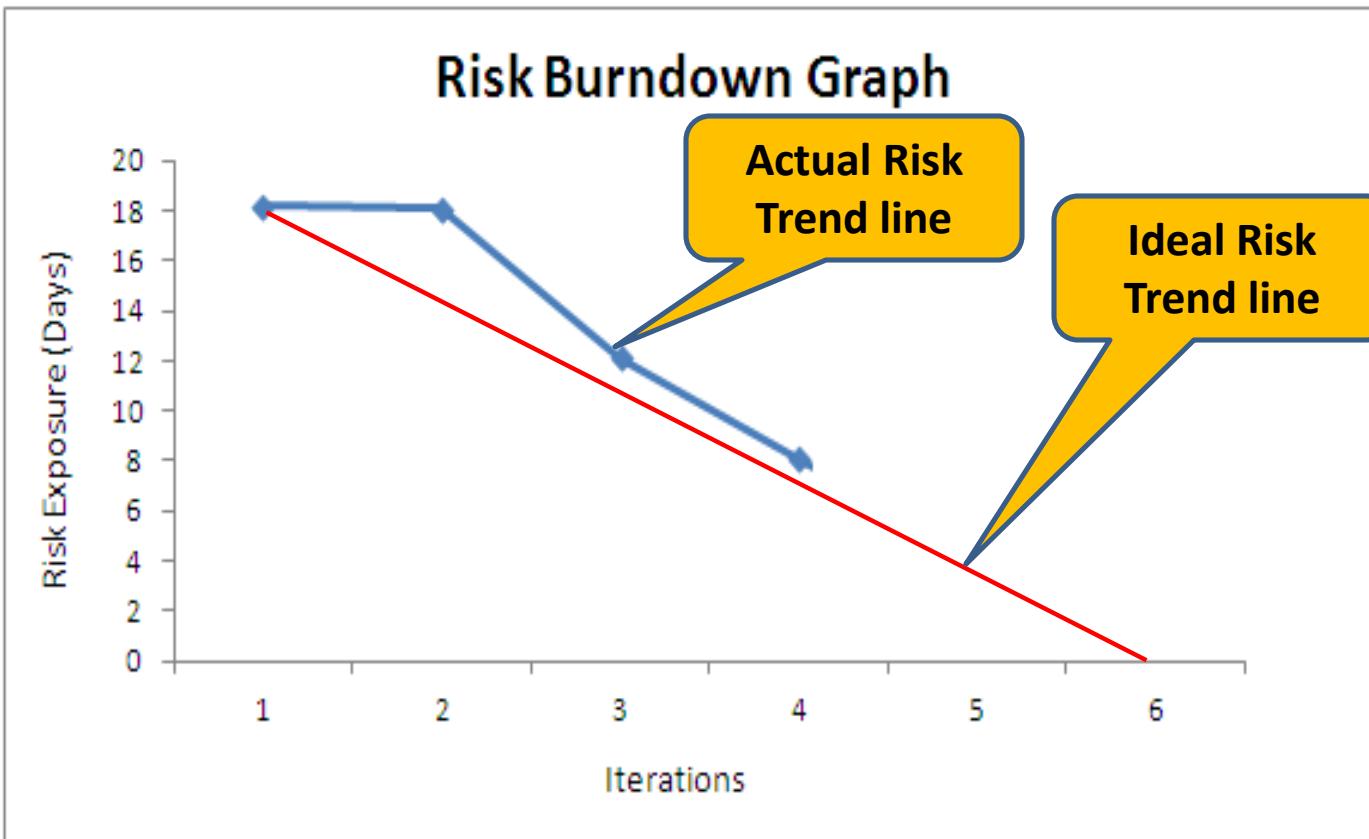

Risk Adjusted Backlog

Risk Score

Risk	Probability	Impact(Days)	Exposure
Internet may be down while working	10%	1	0.1
Lack of experience may take time in implementing functionality	60%	10	6
Backup/store may required additional hardware	80%	5	4
Resource R may not join to support on nn date	50%	8	4
Partner P employee may not be available to validate new features	30%	3	0.9
Component A may not work with the product	40%	8	3.2
Total Risk Impact (Days)			18.2

Risk Burn-down Graph

If actual risk trend line is above than ideal trend line then it means risks are not coming down at the appropriate rate

Identify Risks

- Risk identification is performed for each product backlog items
- Every team member is responsible for identifying risk and updating related data/graph
- Risk Identification techniques
 - Brainstorming Technique
 - Delphi Technique
 - Checklist Analysis

Vedavit

Probability and Impact Matrix

Probability	VL (0.9)	H (0.7)	M (0.5)	L (0.3)	VL (0.1)
	4.5%	9%	18%	36%	72%
	3.5%	7%	14%	28%	56%
	2.5%	5%	10%	20%	40%
	1.5%	3%	6%	12%	24%
	0.5%	1%	2%	4%	8%
	VL (0.05)	L (0.1)	M (0.2)	H (0.4)	VH (0.8)
	Impact				

Which risk you would chose to respond or which you can afford to accept depends upon your risk appetite. Your risk appetite for each risk depends upon the exposure of the risk under consideration.

Qualitative Risk Analysis

- Agile project management prefers Qualitative Risk Analysis method for analysis and prioritization of the risk
- This is the quick and simplest way of risk analysis
- In this method you need to determine probability and impact. Exposure can be calculated by multiplying probability and impact. This step is called probability and impact assessment.
- Rank risks based on their exposure and pick up those top risks which you cannot afford to forego
- Even if you have 50 risks in your risk register do not choose to work upon more than 10 on any point of time.

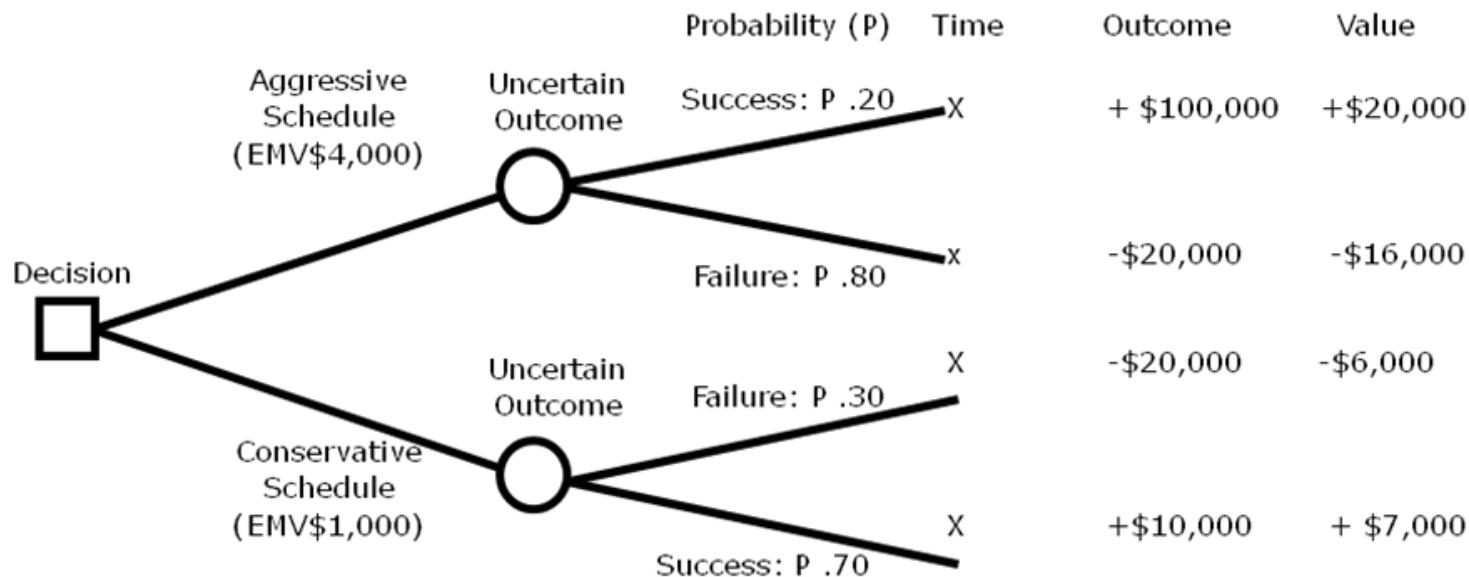

Risk Categorization

- Risk can categorized based on
 - Ranking of risk
 - Cause of risk
 - Response type
 - Priority of risk
 - Any other specific trend

vedavit

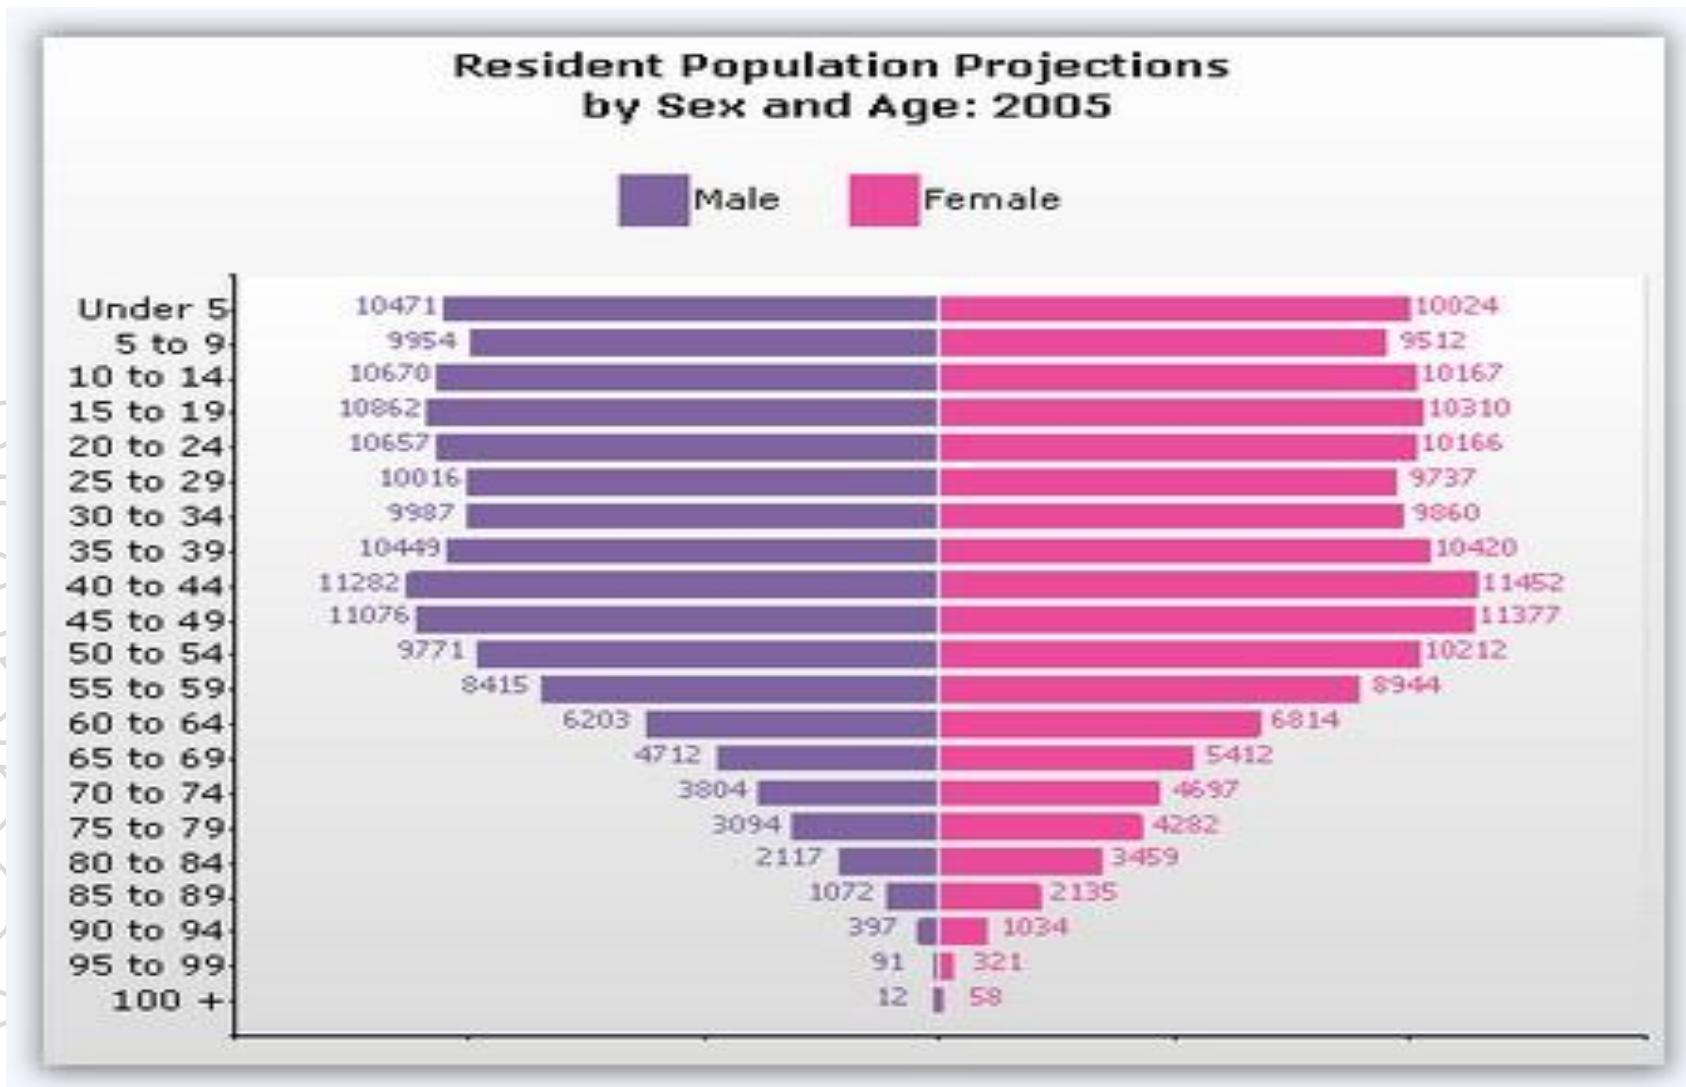

Decision Tree

A decision tree is a diagram that describes a decision under consideration and the implications of choosing one or other available alternatives

- Expected monetary value (EMV) of result Outcome x Probability of that outcome
- Expected monetary value of a decision sum of EMVs of all Outcomes stemming from that decision
- Aggressive schedule has expected monetary value of \$4,000 and is "preferred" over conservative schedule with expected monetary value of \$1,000

Sensitivity Analysis

Addressing an Unknown

In the product backlog sometimes agile team may find some epic/feature/user story which they are not able to understand. Therefore it is difficult to estimate those epic/features/ stories. Keeping the stories in the product backlog as estimated and in priority order is essential, as it gives the product owner insight into approximately which features will be completed by a certain date. There are 2 ways of solving this problem

- Spike Solution
- Tracer Bullet Solution

Addressing an Unknown

- A Spike Solution
 - Spikes allows a team to set some amount of time to research and explore some unknown factor about an upcoming story.
 - Create an experimental solution that cuts through all the “layer”. The code is thrown away once solution is verified. No time is estimated for this kind of solutions but typically 1-2 days time is allowed to create a spike solution. Spike solution can be developed using A technology and actual implementation can be done using B technology.
- Tracer Bullet
 - Create an experimental solution that cuts through all the “layer”. The code is not thrown away once solution is verified but it is extended. This is not time-boxed solution and final implementation should be in the same language in which tracer bullet solution was developed.

vedavit

Risk-based Spikes

- Spike is a technical investigation to research an answer to a problem
- Unlike Technical spike risk-based spikes gets the answer through analysis. Technical spike depends upon technical research and feasibility study.
- Using Risk-based spikes there are four ways to know the answer of any complex problem
 - Sensitivity Analysis
 - Decision Tree Analysis
 - Expected Monetary Value (EVM) Analysis
 - Simulation

Risk Response Plan

Tools & Techniques / Agile Project Risk Management/ Risk Response Plan

1. A Glance on Risk Response Plan
2. Strategies for Negative Risk
3. Strategies for Positive Risk
4. Common Response for +/- Risks

A Glance on Risk Response Plan

Threats or Negative Risk	Opportunities or Positive Risk
Avoid	Exploit
Transfer	Share
Mitigate	Enhance
Accept	Accept

vedavit

Strategies for Negative Risk

Avoid

Risk avoidance involves changing the project management plan to eliminate the threat posed by an adverse risk, to isolate the project objectives from the risk's impact or to relax the objective that is in jeopardy, such as extending the schedule or reducing scope.

Transfer

It requires shifting the negative impact of a threat, along with ownership of the response, to a third party.

Mitigate

It implies a reduction in the probability and / or impact of an adverse risk event to an acceptable threshold. Transference is a form of mitigation.

Strategies Positive Risk

Exploit

It seeks to eliminate the uncertainty associated with a particular upside risk by making the opportunity definitely happen. It may be selected for opportunities where the organization wishes to ensure that it is realized.

Examples include assigning more talented resources to the project to reduce time to completion or to provide better quality than originally planned.

- It is analogous to 'avoidance'

Share

It involves allocating ownership to a third-party who is best able to capture the opportunity for the benefit of the project.

Examples include forming risk-sharing partnerships or joint ventures.

- It is analogous to 'transference'.

Strategies Positive Risk

Tools & Techniques / Agile Project Risk Management/ Risk Response Plan

Enhance

It modifies the ‘size’ of an opportunity by Increasing probability and / or positive impacts and identifying and maximizing key drivers of positive-impact risks.

It seeks to facilitate or strengthen the cause of the opportunity and proactively target and reinforce it’s trigger conditions to increase the probability.

It is analogous to ‘mitigation’.

vedavit

Common Response for +/- Risks

Accept

It is a strategy that is adopted because it is seldom possible to eliminate all risk from a project.

It indicates that the project team

1. Has decided not to change the project management plan to deal with risk or
2. Is unable to identify any other suitable response strategy.

- **Active Acceptance** most commonly involves establishing a '**contingency reserve**', including amounts of time, money or resources to handle known or unknown threats or opportunities.

- **Passive Acceptance** requires no action, leaving the project team to deal with threats or opportunities as they occur.

Monitoring & Controlling Risk

Tools and techniques to monitor and control risks

- Risk Audit
- Secondary Risk
- Residual Risk
- Workarounds
- Reserve Analysis

vedavit

Understanding Reserves

Contingency reserves : Known – Unknown

- It is designed for use only if certain events occur or only under certain predefined conditions, provided there is sufficient warning to implement the response.
- Examples of events that may trigger the contingency response include missing intermediate milestones or gaining higher priority with a supplier.
- Events triggering the contingency response should be triggered and tracked.

Management reserves: Unknown – Unknown

It is defined for use only if ‘the events that occur or only under certain conditions’, where information about the event & its occurrence is absolutely NOT available.

No use of running fast on wrong road. So, first choose your road.

Selfless, Dedicated, Fair, Accepts Complete Responsibility, Passionate, Balance in life, Full of Love, Warmth & Respect for all type of resources including natural resources entrusted

Professional Responsibility
As
Integrated Part of Complete
Project Life Cycle

Honesty

Honesty is our duty to understand the truth and act in a Truthful manner both in our communication and in our conduct

1. We earnestly seek to understand the truth
2. We are truthful in our communications and conduct and provide in timely manner
3. We make commitments and promises in good faith (implied & explicit)
4. We do not engage on or condone behavior that is designated to deceive others
5. We do not engage in dishonest behavior with the intention of personal gain or at the expense of other.

Responsibility

Responsibility is our duty to take ownership for the decisions we make or fail to make, the actions we take or fail to take & the consequences that result

1. Make decisions and take actions based on the BEST interests of society, Public safety and the environment
2. We accept those assignments that are consistent with our background, experience, skills and qualifications
3. We inform ourselves and uphold the policies, rules and regulations and laws that govern s our work, professional and volunteer activities
4. We report unethical or illegal conduct to appropriate management & if necessary to those affected by the conduct
5. We bring violations of this Code to the attention of the appropriate body for resolution. We only file ethics complaints when they are substantiated by facts.

Respect

Respect is our duty to show a high regard for ourselves, others and the resources entrusted to us

1. We inform ourselves about norms and customs of others and avoid engaging in behaviors they might consider disrespectful
2. We listen to others points of view , seeking to understand them
3. We approach directly those persons with whom we have conflict
4. We conduct ourselves in a professional manner
5. We negotiate in good faith, do not exercise the power of our expertise or position to influence decisions

Fairness

Fairness is our duty to make decisions and act impartially & Objectively. Our conduct must be free from competing self interest , Prejudice and favoritism.

1. We demonstrate transparency in decision making and constantly re-examine our impartiality .
2. We provide equal access to information to those authorized & equal opportunities to qualified candidates
3. We do not discriminate against others based on, but not limited to , Gender, Race, Age, Religion, Disability, Nationality or Sexual orientation.

vedavit

Fairness

Conflict of Interest:

1. We proactively and fully disclose any real or potential conflicts of interest to the appropriate stakeholders.
2. When we realize that we have a real or potential conflict of interest:
 - We refrain from engaging in the decision making process or otherwise
 - attempting to influence outcomes, unless or until we have made full
 - disclosure to the affected stakeholders.
3. We do not hire or fire, reward or punish, or award or deny contracts based on personal considerations. Including but not limited to Favoritism, Nepotism, or Bribery.

Ethics Quick Test

Texas Instruments “Ethics Quick Test” for making ethical decisions

- ✓ Is the action legal?
- ✓ Does it comply with your understanding of company values?
- ✓ If you do it, will you feel bad?
- ✓ How will it look in the newspaper?
- ✓ If you know it is wrong, do not do it.
- ✓ If you are not sure, ask.
- ✓ Keep asking until you get an answer.

Agile Project Manager's Oath of **Professional Responsibility**

vedavit

Professional Responsibility

- ✓ Ensure individual integrity
- ✓ Adhere to legal requirements and ethical standards
- ✓ Protect Stakeholders
- ✓ Share lessons learned and other relevant information
- ✓ Build capabilities of colleagues
- ✓ Advance project management professionalism
- ✓ Improve competencies as project manager
- ✓ Balance stakeholder interests in project
- ✓ Respect cultural ethnic and personal differences
- ✓ Ensure collaborative project management environment
- ✓ Comply with all organizational rules and policies

Professional Responsibility

- ✓ Provide accurate and truthful representations in cost estimates
- ✓ Provide accurate and truthful representations in project reports
- ✓ Report violations of policies, procedures and code of ethics
- ✓ Strive for fair resolutions
- ✓ Satisfy competing needs and objectives
- ✓ Interact with others in a professional manner
- ✓ Be responsible for satisfying the complete scope and objectives of customer requirements
- ✓ Maintain and respect confidential information

Professional Responsibility

- ✓ Ensure that a conflict of interest does not interfere with professional judgment
- ✓ Disclose conflict of interest to customer
- ✓ Disclose circumstances that could be construed as conflicts of interest
- ✓ Refrain from offering or accepting inappropriate payments, gifts, or other forms of compensation
- ✓ Adhere to all applicable laws or customs of the country where services are being provided
- ✓ Respect intellectual property developed or owned by others
- ✓ Act in an accurate, truthful and competent manner

Recap

6 Domains & Their Task

1- Value Driven Delivery

Define Positive Value

- **To define business values**
 - Define features and project work
 - As a delivery team focus on maximizing value-added activities
 - As a delivery team Focus on minimizing non-value-added activities
 - Understand end-user and stakeholder value
- **To optimize business values and surface new information**
 - Solicit feedback and lessons learned
 - Incorporate experience from each delivery
- **To shared definition of “done”**
 - Identify most important featured on just-in-time bases
 - Sharpen the requirement by defining acceptance criteria
 - Articulate a shared definition of “done”
- **To tailor Process**
 - Understand organizational characteristics
 - Select and tailor project methodology to maximise project success.

1- Value Driven Delivery

Incremental Development

- **To achieve rapid ROI and quick feedback,** (a) identify minimally marketable (MMF). (b) Organize MMF, requirements, into small releasable system increments
- **To plan exposure of problems at early and minimal cost,** define product increments for both internal evaluation and external release. Problem may be related to integration, performance, requirements, compatibility, usability etc
- **To release high-quality deliverables to stakeholders,** take quick feedback on the value of deliverable frequently
- **To optimize Benefit-to-Cost of the developed system,** investigate and communicate termination opportunities
- **To reduce the overall cost of incremental development,** timely updating the internal design

Avoid Potential Downsides

- **To manage unknown affect of risks on project outcome,** use POC or spikes.
- **To ensure stakeholders are aware and their expectations are managed,** conduct operational reviews or periodic checkpoints
- **To ensure functionality meets customer need,** solicit customer feedback by developing and demonstrating working integrated stages of the system

1- Value Driven Delivery

Prioritization

- **To balance stakeholder values, business value, and residual risk**
 - Prioritize both features and related project work
 - Incorporate both value and risk elements into the requested work
- **To reflect changes in the environment and stakeholder understanding**, reprioritize requirements periodically
- **To minimize the impact of failure**, elicit non-functional requirements and ensure that the solution satisfies operational and maintenance parameters

vedavit
@ Vedavit

2- Stakeholder Engagement

Stakeholder Needs

- **To ensure that team's knowledge about an agreed, prioritized feature set reflecting all stakeholder's interests, identify and engage effective and empowered business stakeholders**
- **To unimpeded flow of value throughout the lifespan of the project**
 - Identify and engage all stakeholders (current and future)
 - Promote knowledge sharing early and throughout the project

Stakeholder Involvement

- **To promote effective collaboration and participation of stakeholders on project activities, establish stakeholder relationships by forming a working agreement among all stakeholders**
- **To ensure new stakeholders on the project are appropriately engaged**
 - Continually assess the changes in the project and organization that affect the stakeholder landscape
 - Maintain proper stakeholders' involvement

2- Stakeholder Engagement

Stakeholder Expectations

- **To align expectations and build trust**
 - Facilitate awareness among stakeholders
 - Establish and maintain a shared understanding of success criteria, deliverables and acceptable trade-offs
- **To help the business stakeholders make informed decisions about scope, time and cost**
 - Communicate team progress
 - Communicate Development capabilities
- **To give greater assurance to stakeholders that project outcomes will help them meet their business objectives.**
 - Manage stakeholders' expectations around minimal/most likely/optimal project outcomes
 - Balance accuracy and precision

3- Boosting Team Performance Practices

Team Formation

- **To remove fear of conflict and strengthen member's commitment to shared outcomes.**
 - Facilitate the team in collectively creating ground rules and internal processes
- **To enable the team to deliver on their commitment.**
 - Help forming cross-functional teams
 - Ensure all skills and resources necessary are readily available
- **To maximize teamwork and reduce bottlenecks.**
 - Identify team members that have the right combination of soft and technical skills
 - Encourage them to be generalizing specialists
- **To ensure cohesion between team members**
 - Ensure the team has common understanding of the values and principles of agile
 - Ensure the team has common knowledge around the agile practices and terminology
 - Ensure value, principle, practices are being used.

3- Boosting Team Performance Practices

Team Empowerment

- **To manage the project's complexity and produce effective solutions,** empower the team to self-organize around the work
- **To ensure that team learn and continually improve the way they work**
 - Create a safe team environment
 - Allow people to experiment and make reasonable mistakes
- **To ensure that team remains motivated and productive throughout the project,** continuously discover team and personal motivators and de-motivators

vedavit

3- Boosting Team Performance Practices

Team Collaboration

- **To allow team to take responsibility for outcomes and improve their effectiveness**
 - Establish collaborative behaviours among all team member
 - Apply group decision making and conflict resolution techniques
- **To reduce the cost of miscommunication and rework**
 - Use collocation or collaborative tools
 - Facilitate close communication within the team

Team Commitment

- **To establish a predictable outcome and optimize the value delivered**
 - Protect the team from outside distractions
 - Help them in making commitment
- **To ensure that the team understand how their objectives fit into the overall goals of the project**
 - Share project vision
 - Align team objectives with project objectives
- **To gain a better understanding of team's velocity and commitment**
 - Encourage the team to measure its capacity
 - Tracking and measuring actual deliverables in previous cycles

4- Adaptive Planning

Levels of Planning

- **To support the necessary level of understanding**
 - Plan at multiple levels (strategic, release, iteration, daily etc.)
 - Creating appropriate detail using rolling wave planning and progressive elaboration
- **To gain increased levels of commitment**
 - Engage the team and customer in planning activities
 - Create practical plans that balance priorities and team capabilities
- **To set and manage sponsor expectations**
 - Make specific commitments to project sponsors
 - Manage expectations around those commitments based on actual project experience

Adaptation

- **To adapt as per the business need**
 - Understand project characteristics and/or the size/complexity/criticality of the project deliverables
 - Coach the team to adjust the cadence and the planning process based on above understanding
- **To maximize business value delivered**
 - Inspect and adapt the project plan to reflect changes
 - Changes may be in requirements, schedule, budget, and shifting priorities
 - Changes may be based on team learning, delivery experience, feedback, and defects

4- Adaptive Planning

Estimation

- **To encourage the team to create estimates**
 - The estimates reflect current understanding of the effort to deliver the project
 - The estimates includes delivery aspects like analysis, development, test, refactoring, deployment preparation, etc.
- **To manage stakeholder expectations**, refine estimate ranges so that the refined estimates reflect current level of uncertainty, ability and skills of team

Velocity/Throughput Cycle Time

- **To gauge progress and extrapolate completion**, capture a measure of the accepted work completed in a given time frame
- **To ensure team does not over commit**, adjust planning capacity by considering maintenance and operations demand

5- Problem Detection and Resolution

- **To surface problems and impediments that are slowing the team down or preventing its ability to deliver values,** create an open and safe environment
- **To identify risks and create mitigation strategies,** proactively engage the team at various points in the project
- **To create high productivity culture,** ensure impediments are resolved and/or reset expectations in view of impediments that cannot be resolved
- **To elevate accountability and track ownership and resolution status of risks and impediments,** maintain a visible list of the same.
- **To manage the expectations of the impacted stakeholders,** communicate status of risk and impediments

6- Continuous Improvement (Product, Process, People)

- **To ensure that team is effective within established organizational norms**, tailor the process to the project by adapting practices for the team, organization culture and delivery goals.
- **To improve process, individuals, and team effectiveness**, incorporate feedback by conducting frequent retrospectives
- **To improve efficiency within the existing process with a goal of keeping a team together for long term**, adjust team composition and work practices
- **To become more efficient**, remove wasteful process elements by challenging existing process elements
- **To avoid re-occurrence of problems identified, improving the effectiveness of the organization as a whole**, create systemic improvements by disseminating knowledge and practices across project and organizational boundaries
- **To improve overall team effectiveness and lowering risk around knowledge silos**, improve team member knowledge and skills by pairing team members
- **To identify opportunities to reduce waste**, evaluate work efficiency
- **To discover more efficient and effective ways of working**, experiments with new techniques and process ideas for short periods
